# Transcription Factor Nobel Prizes

(Question-driven science and well-designed screens)

Q: Which *Drosophila* genes are important for developmental patterning?

1995: Classic genetics (perturb, observe, map) identifies proteins (>50% were TFs!) critical for *Drosophila* development

Q: Can we reprogram differentiated cells to a pluripotent state?

2012: Brute force candidate gene screen. Transduce 24 genes that are specifically expressed in embryonic stem cells into fibroblasts. Systematically narrow down the list: Oct3/4, Klf4, Sox2, and c-Myc (all TFs!)

# Transcription dysregulation alters developmental patterning

pseudocolored flies: Justin Crocker, Ed Lewis, Nicolas Gompel, and Welcome Bender

# Classic Genetics: Perturb and Map

pseudocolored flies: Justin Crocker, Ed Lewis, Nicolas Gompel, and Welcome Bender

pseudocolored SEM heads: Jürgen Berger

Classic genetics (perturb, observe, map) found that Transcription Factors control developmental patterning

Figure 3. *Cellular Function of Heidelberg Mutations.* Based on the sequence of 75 cloned genes, most of the loci identified in Heidelberg encode transcription factors, or cell signals and receptors.

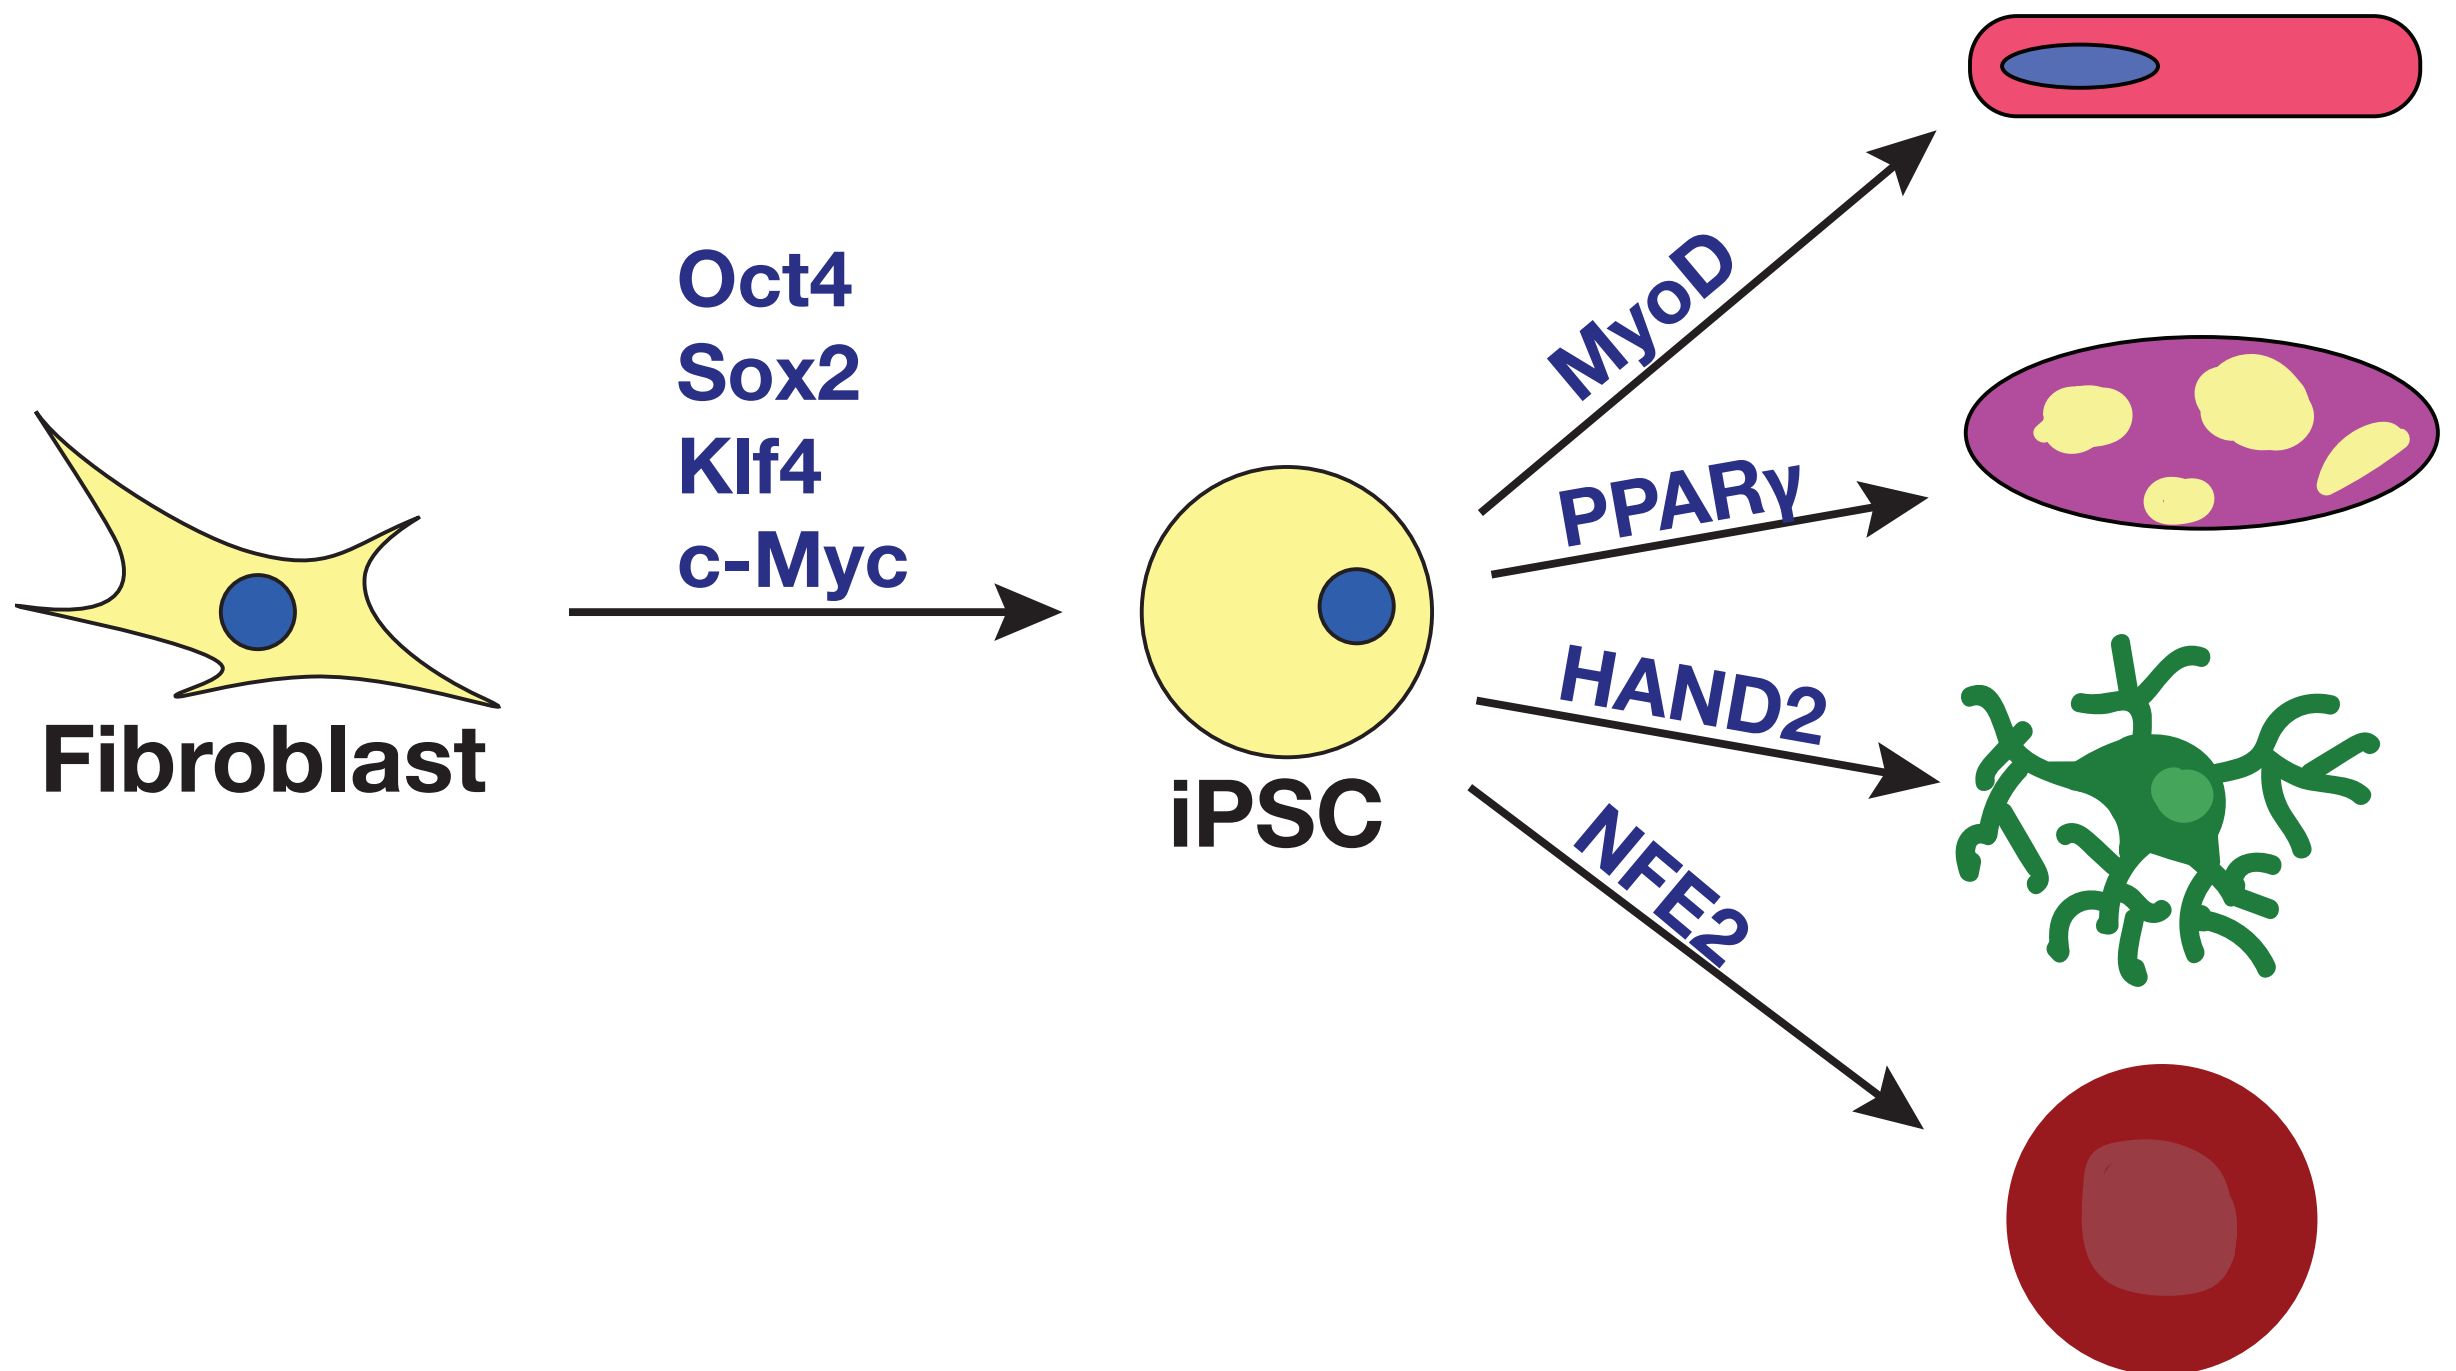

# Transcription factors drive changes in cell identity

Brute force screening approach:  
express many genes in combination until we get iPSCs

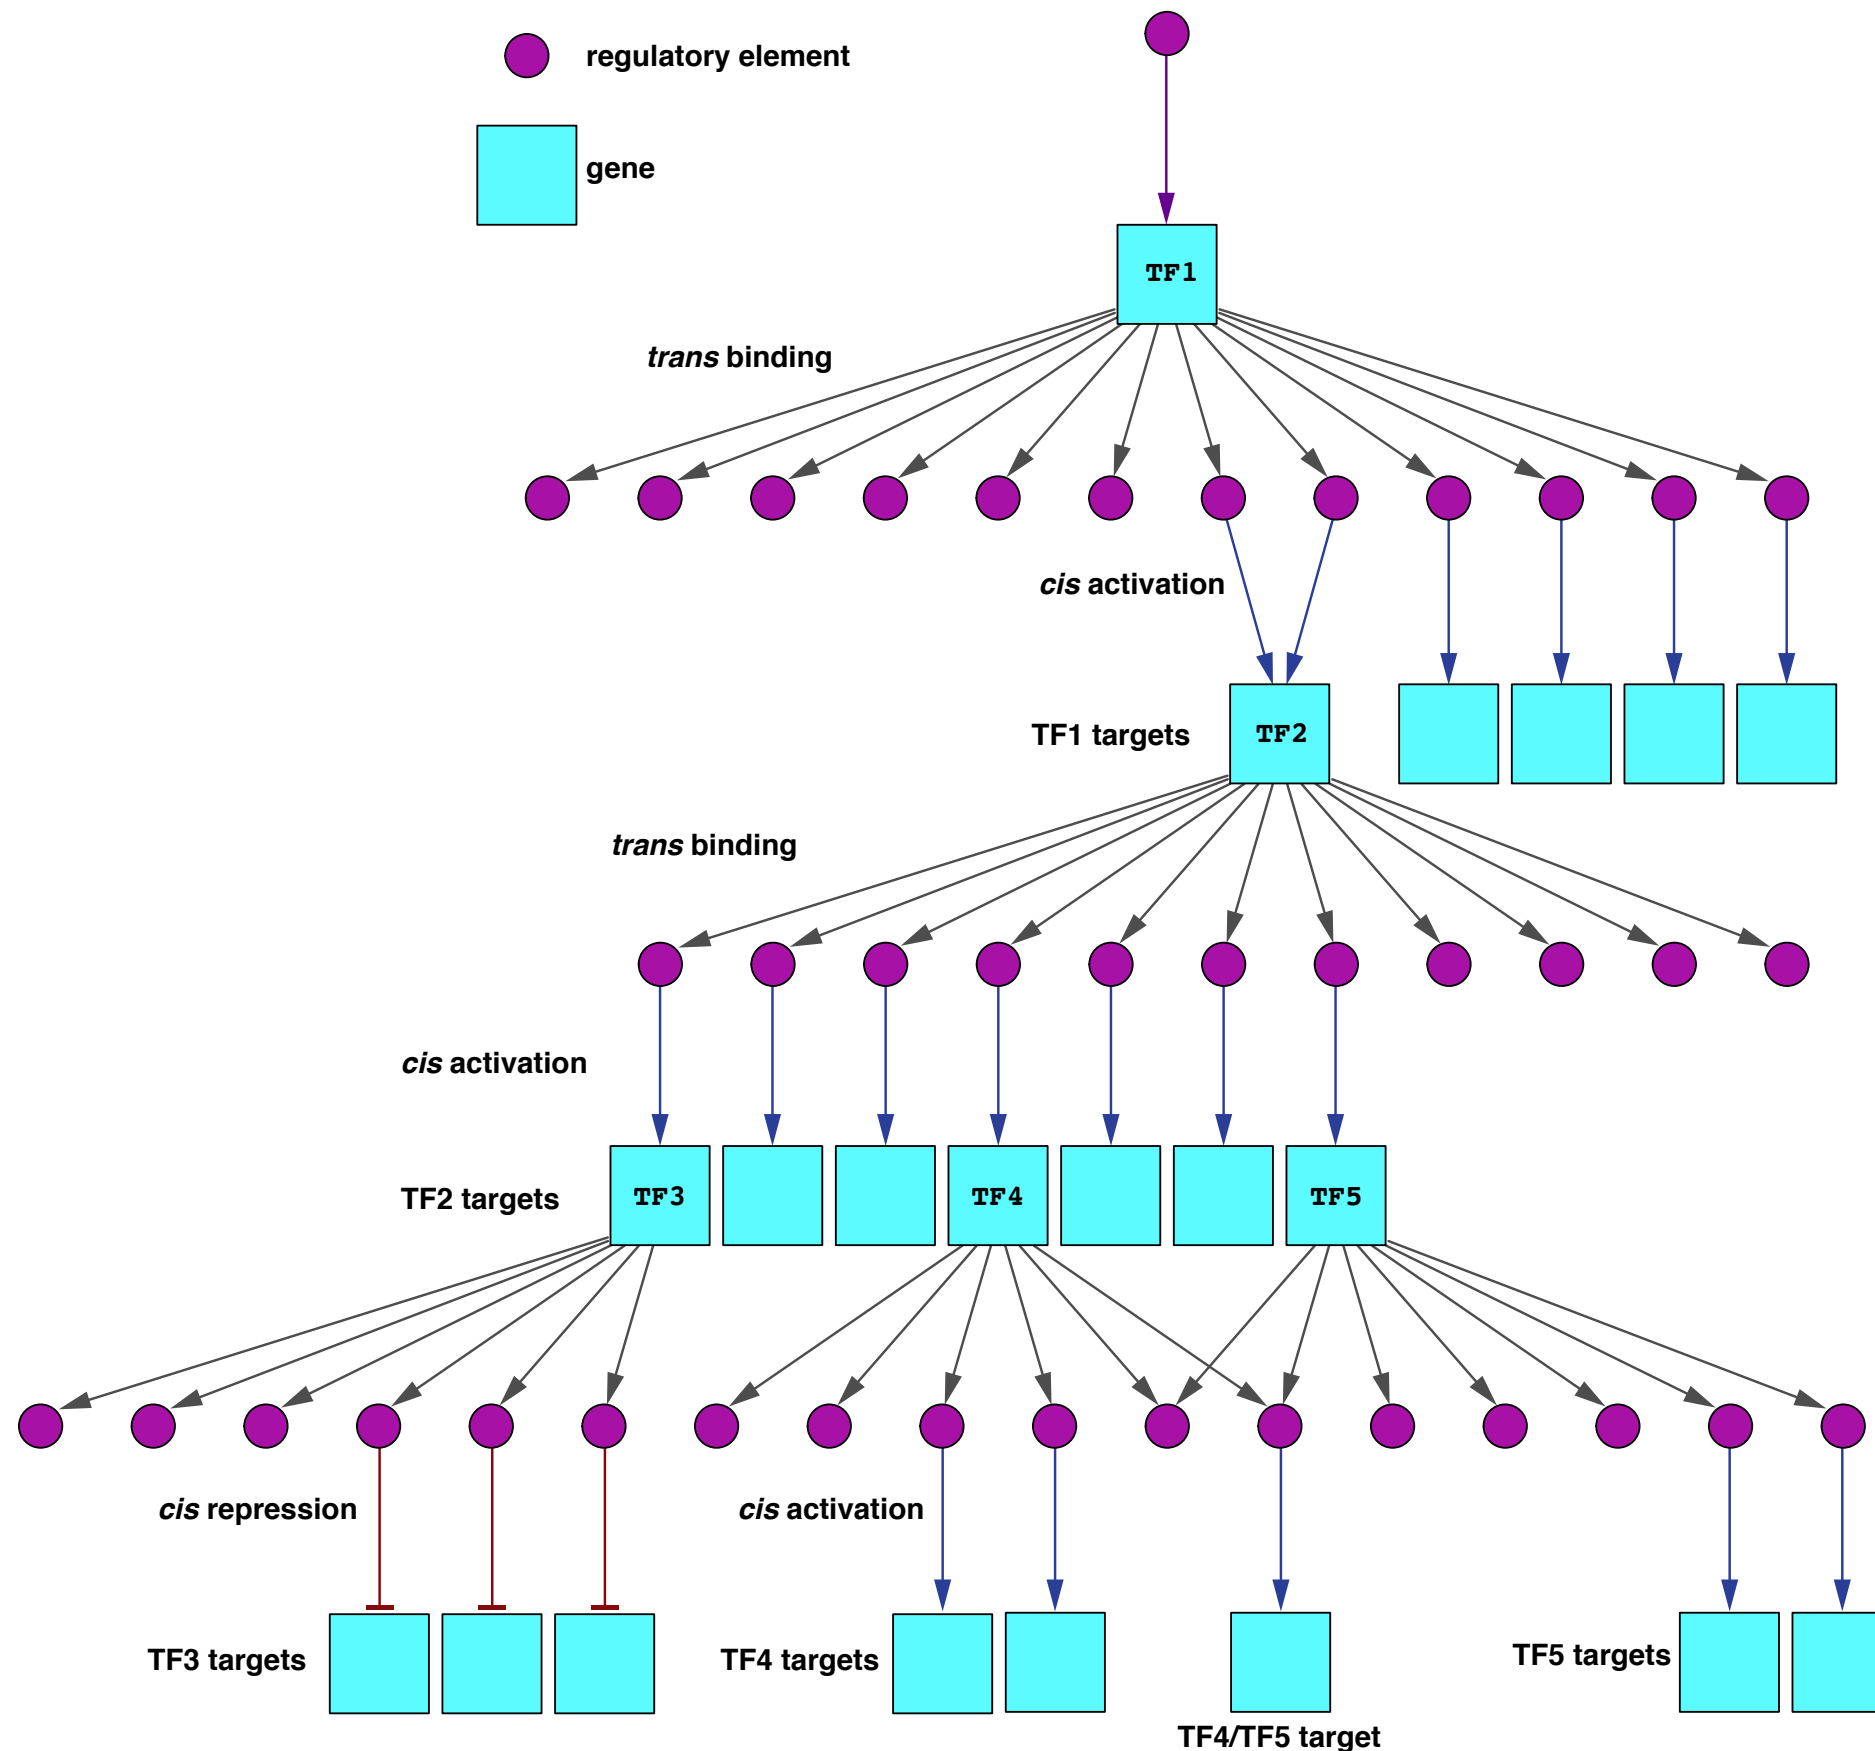

# Transcription factors drive changes in cell identity

Takahashi & Yamanaka, Cell 2006  
2012 Nobel Prize shared with John Gurdon

# Which TFs and regulatory elements are important in regulatory cascades?

# What are the step(s) in transcription that each key TF regulates?

# Possible approaches and considerations

# Possible approaches and considerations

- ChIP-seq all the TFs throughout the cascade, but which TFs?

# Possible approaches and considerations

- ChIP-seq all the TFs throughout the cascade, but which TFs?
- ATAC-seq gives us putative regulatory elements, but which TFs are binding/dissociating during the cascade?

# Possible approaches and considerations

- ChIP-seq all the TFs throughout the cascade, but which TFs?
- ATAC-seq gives us putative regulatory elements, but which TFs are binding/dissociating during the cascade?
- RNA-seq quantifies changes in gene expression, but detection is delayed depending on RNA turnover rate and accumulation rate over basal RNA levels.

# Possible approaches and considerations

- ChIP-seq all the TFs throughout the cascade, but which TFs?
- ATAC-seq gives us putative regulatory elements, but which TFs are binding/dissociating during the cascade?
- RNA-seq quantifies changes in gene expression, but detection is delayed depending on RNA turnover rate and accumulation rate over basal RNA levels.
- Which time points do we choose?

# Possible approaches and considerations

- ChIP-seq all the TFs throughout the cascade, but which TFs?
- ATAC-seq gives us putative regulatory elements, but which TFs are binding/dissociating during the cascade?
- RNA-seq quantifies changes in gene expression, but detection is delayed depending on RNA turnover rate and accumulation rate over basal RNA levels.
- Which time points do we choose?
- Which models can we genetically manipulate to validate candidate TFs and elements?

# Outline

- Question-driven science and well-designed studies
- Mechanistic insights from genomics-derived gene regulatory networks
- Rapid protein degradation to study transcription factor interaction

# Kinetic networks identify key regulatory nodes and transcription factor functions in early adipogenesis

# Adipogenesis of 3T3-L1 cells

# Adipogenesis of 3T3-L1 cells

# Experimental Design

# Transposase Hypersensitivity (ATAC-seq)

# Transposase Hypersensitivity (ATAC-seq)

- A general measure of chromatin structure.

# Transposase Hypersensitivity (ATAC-seq)

- A general measure of chromatin structure.
- ATAC peaks and DNA motifs can be used to infer TF binding (i.e. if chromatin is accessible and contains a binding sequence, then a TF may be bound)

# Transposase Hypersensitivity (ATAC-seq)

# Transposase Hypersensitivity (ATAC-seq)

# Transposase Hypersensitivity (ATAC-seq)

# PRO-seq detects nascent RNA

# Precision Genomic-Run On (PRO-seq)

# Precision Genomic-Run On (PRO-seq)

# Precision Genomic-Run On (PRO-seq)

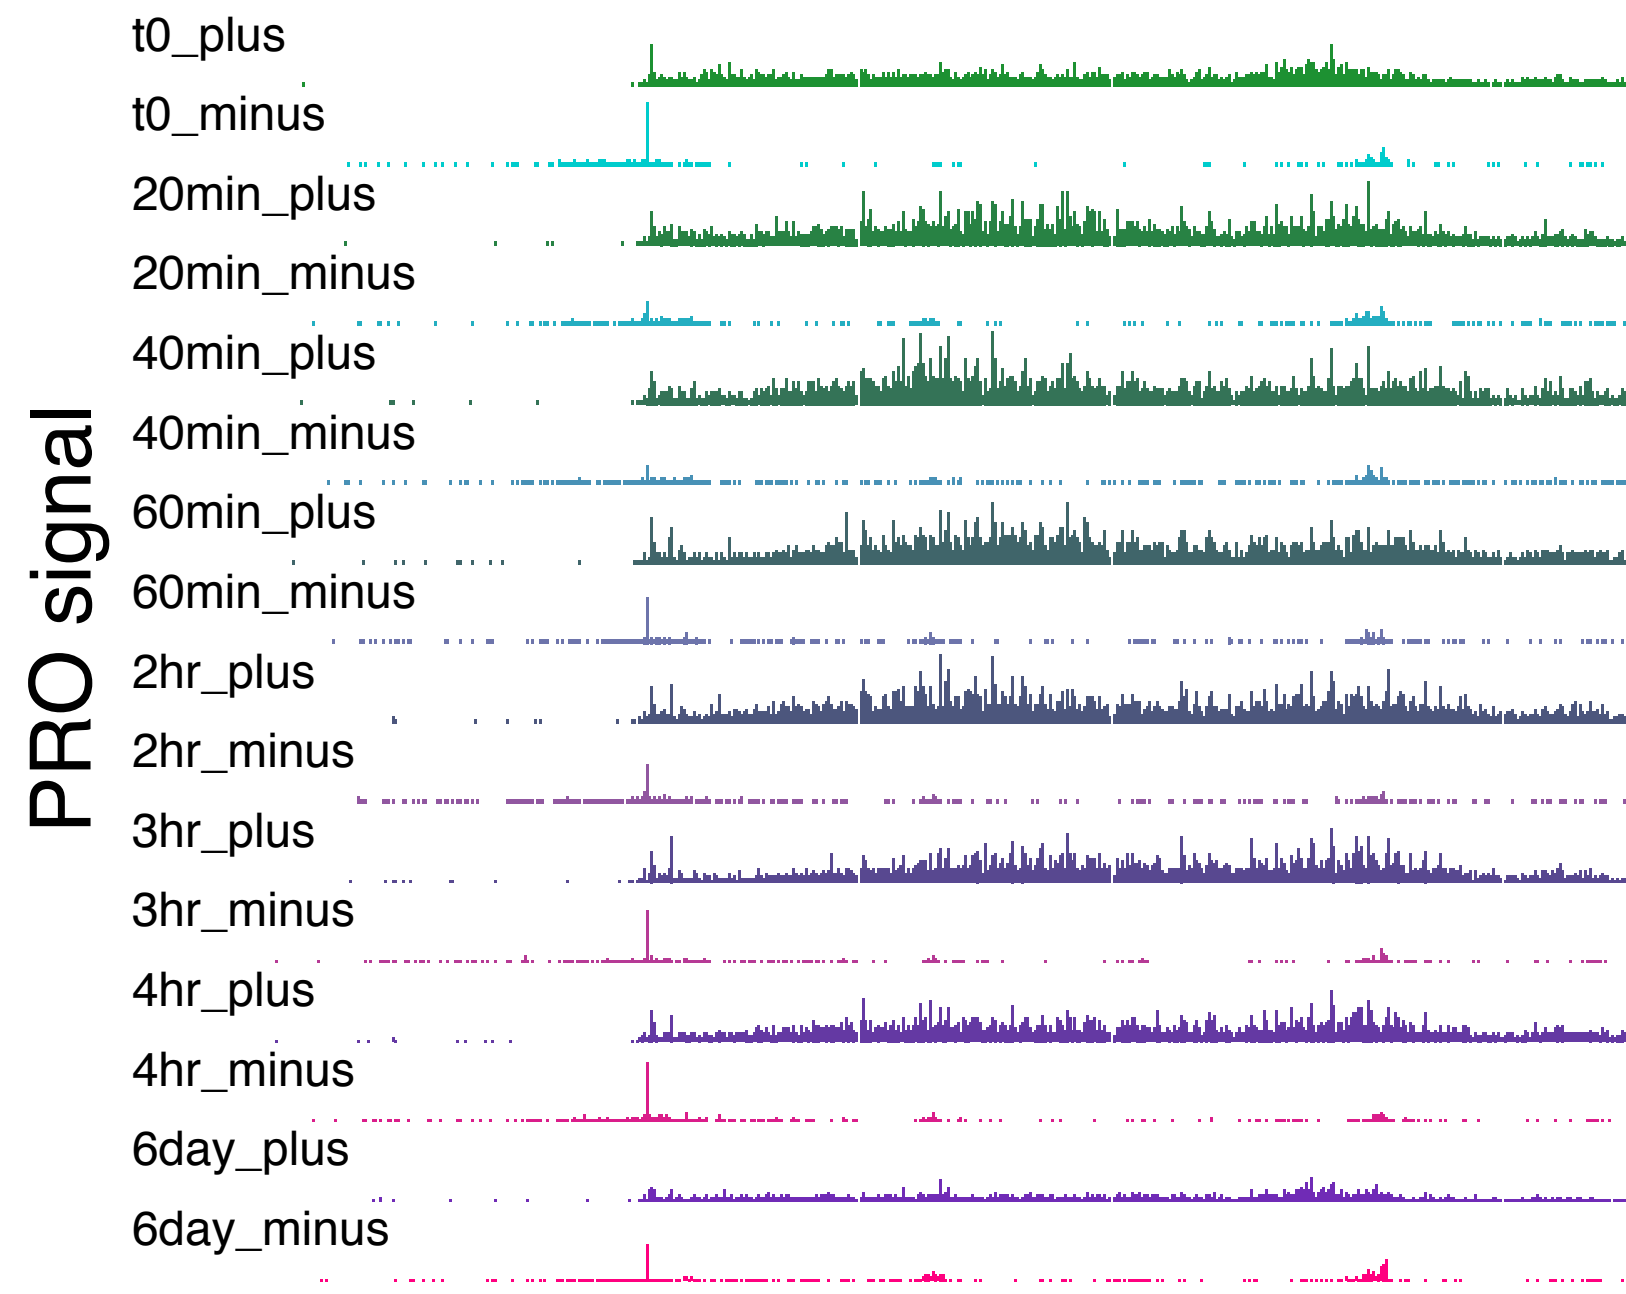

# PRO-seq measures immediate responses

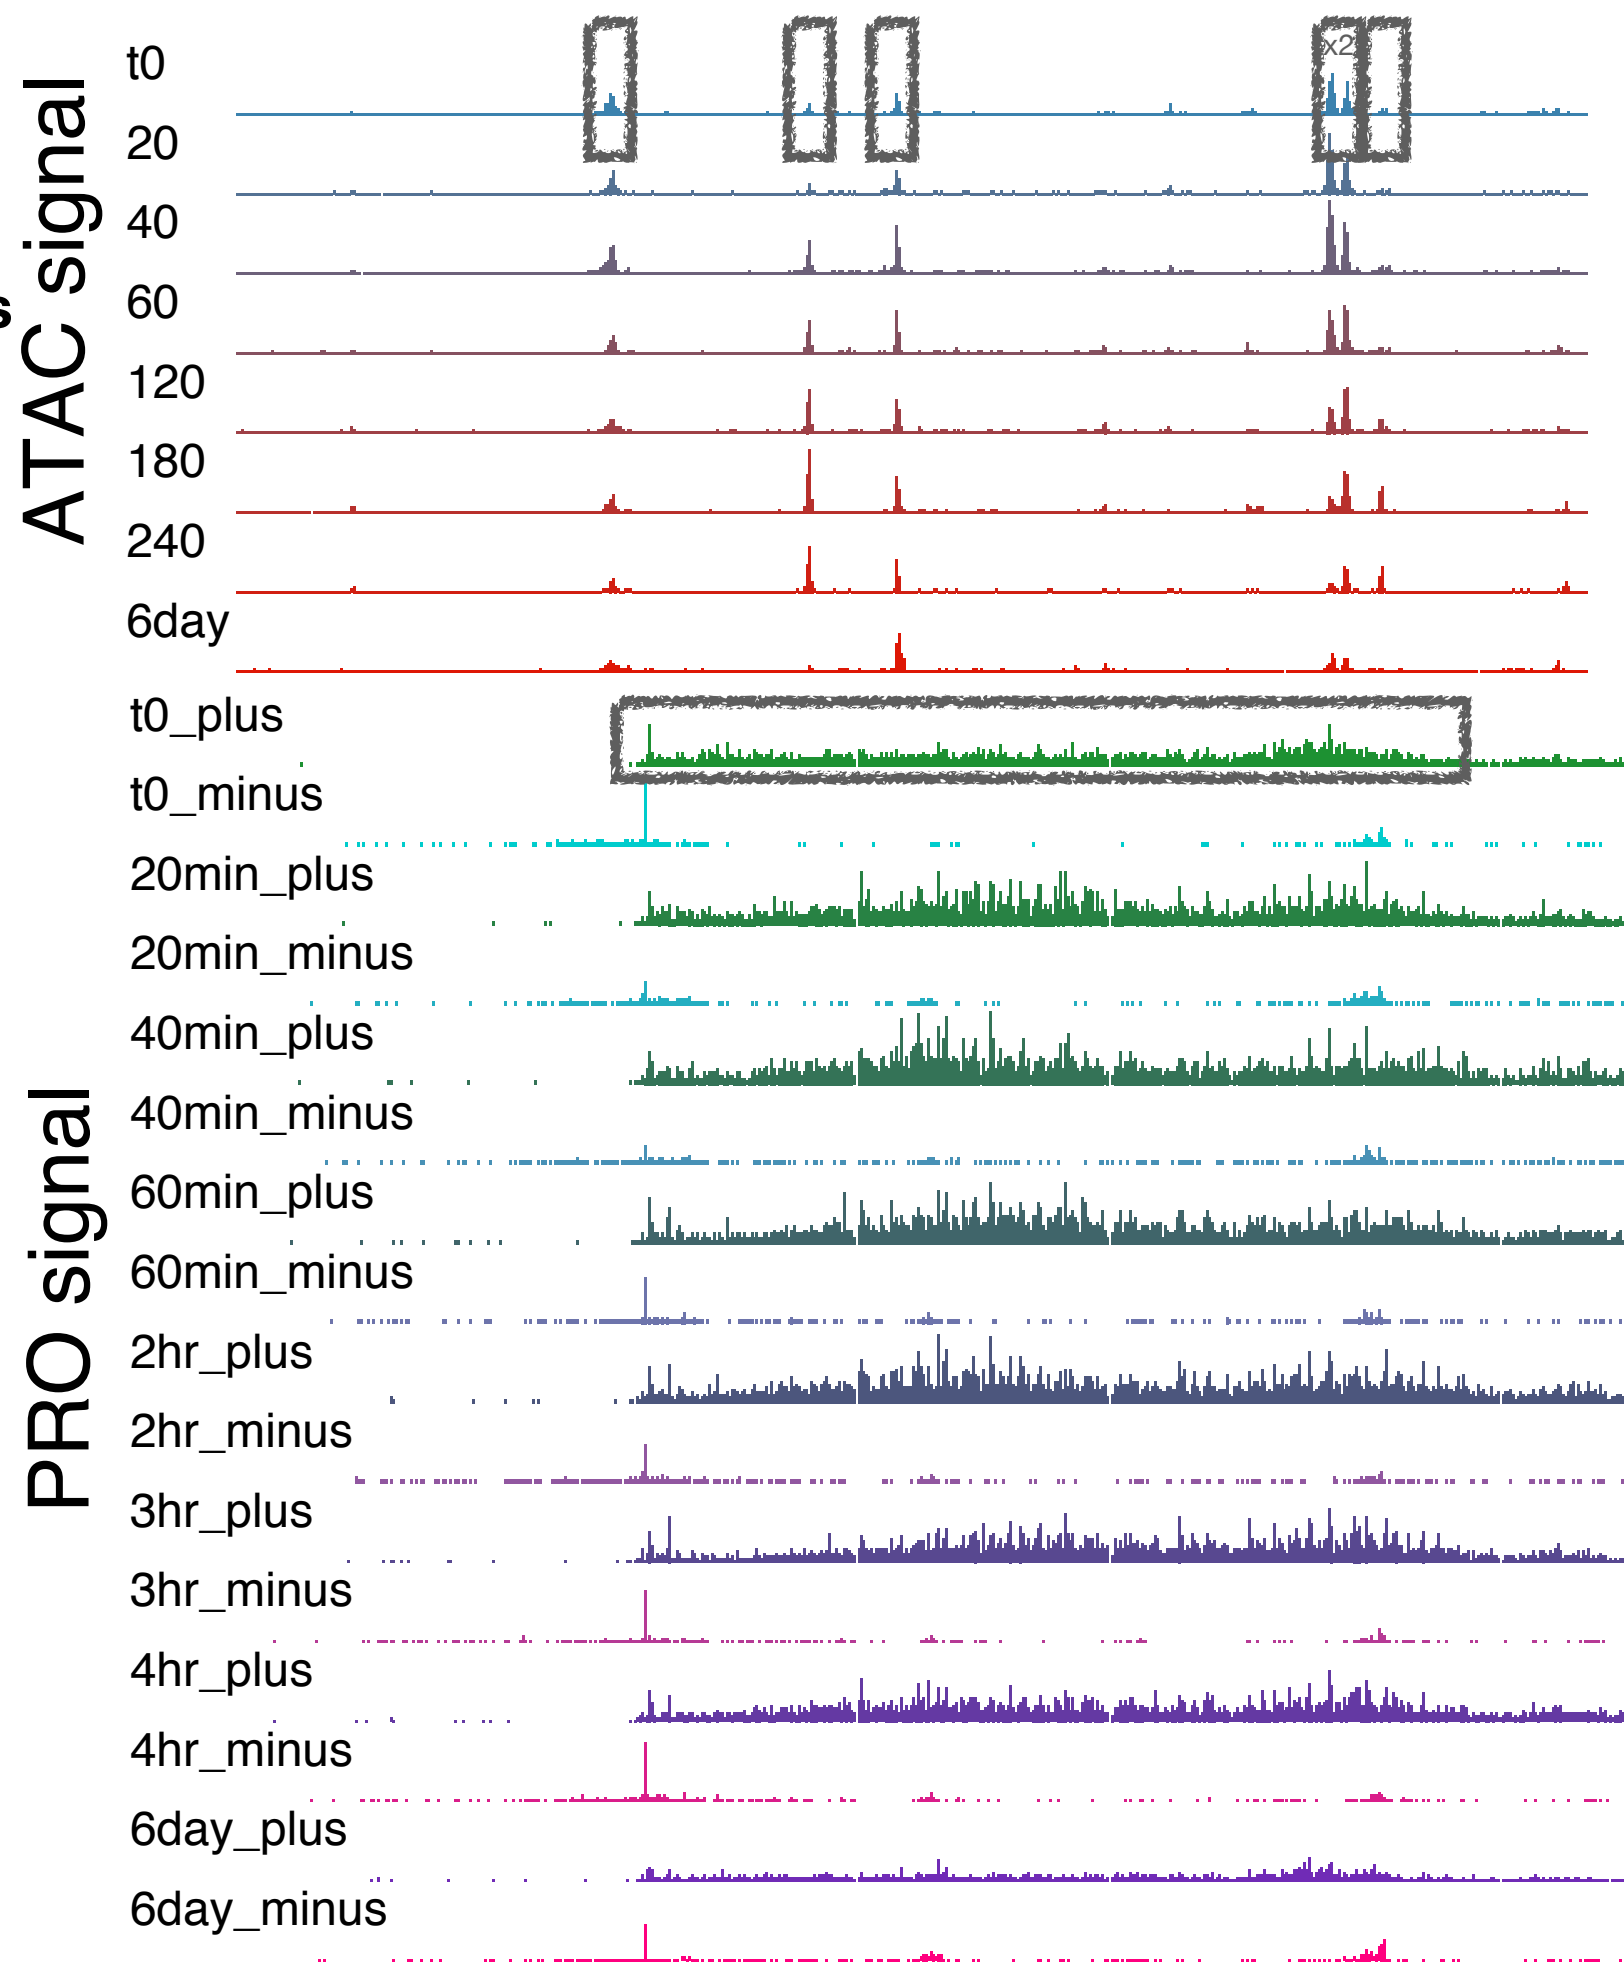

~200,000 peaks

~30,000 genes

~200,000 peaks

# Interesting ATAC-seq peaks are dynamic over the time course

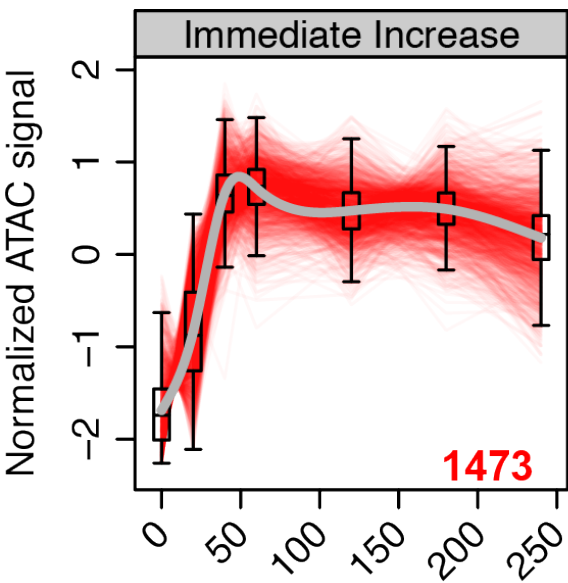

# *de novo* motif analysis identifies enriched sequence elements within dynamic ATAC peaks

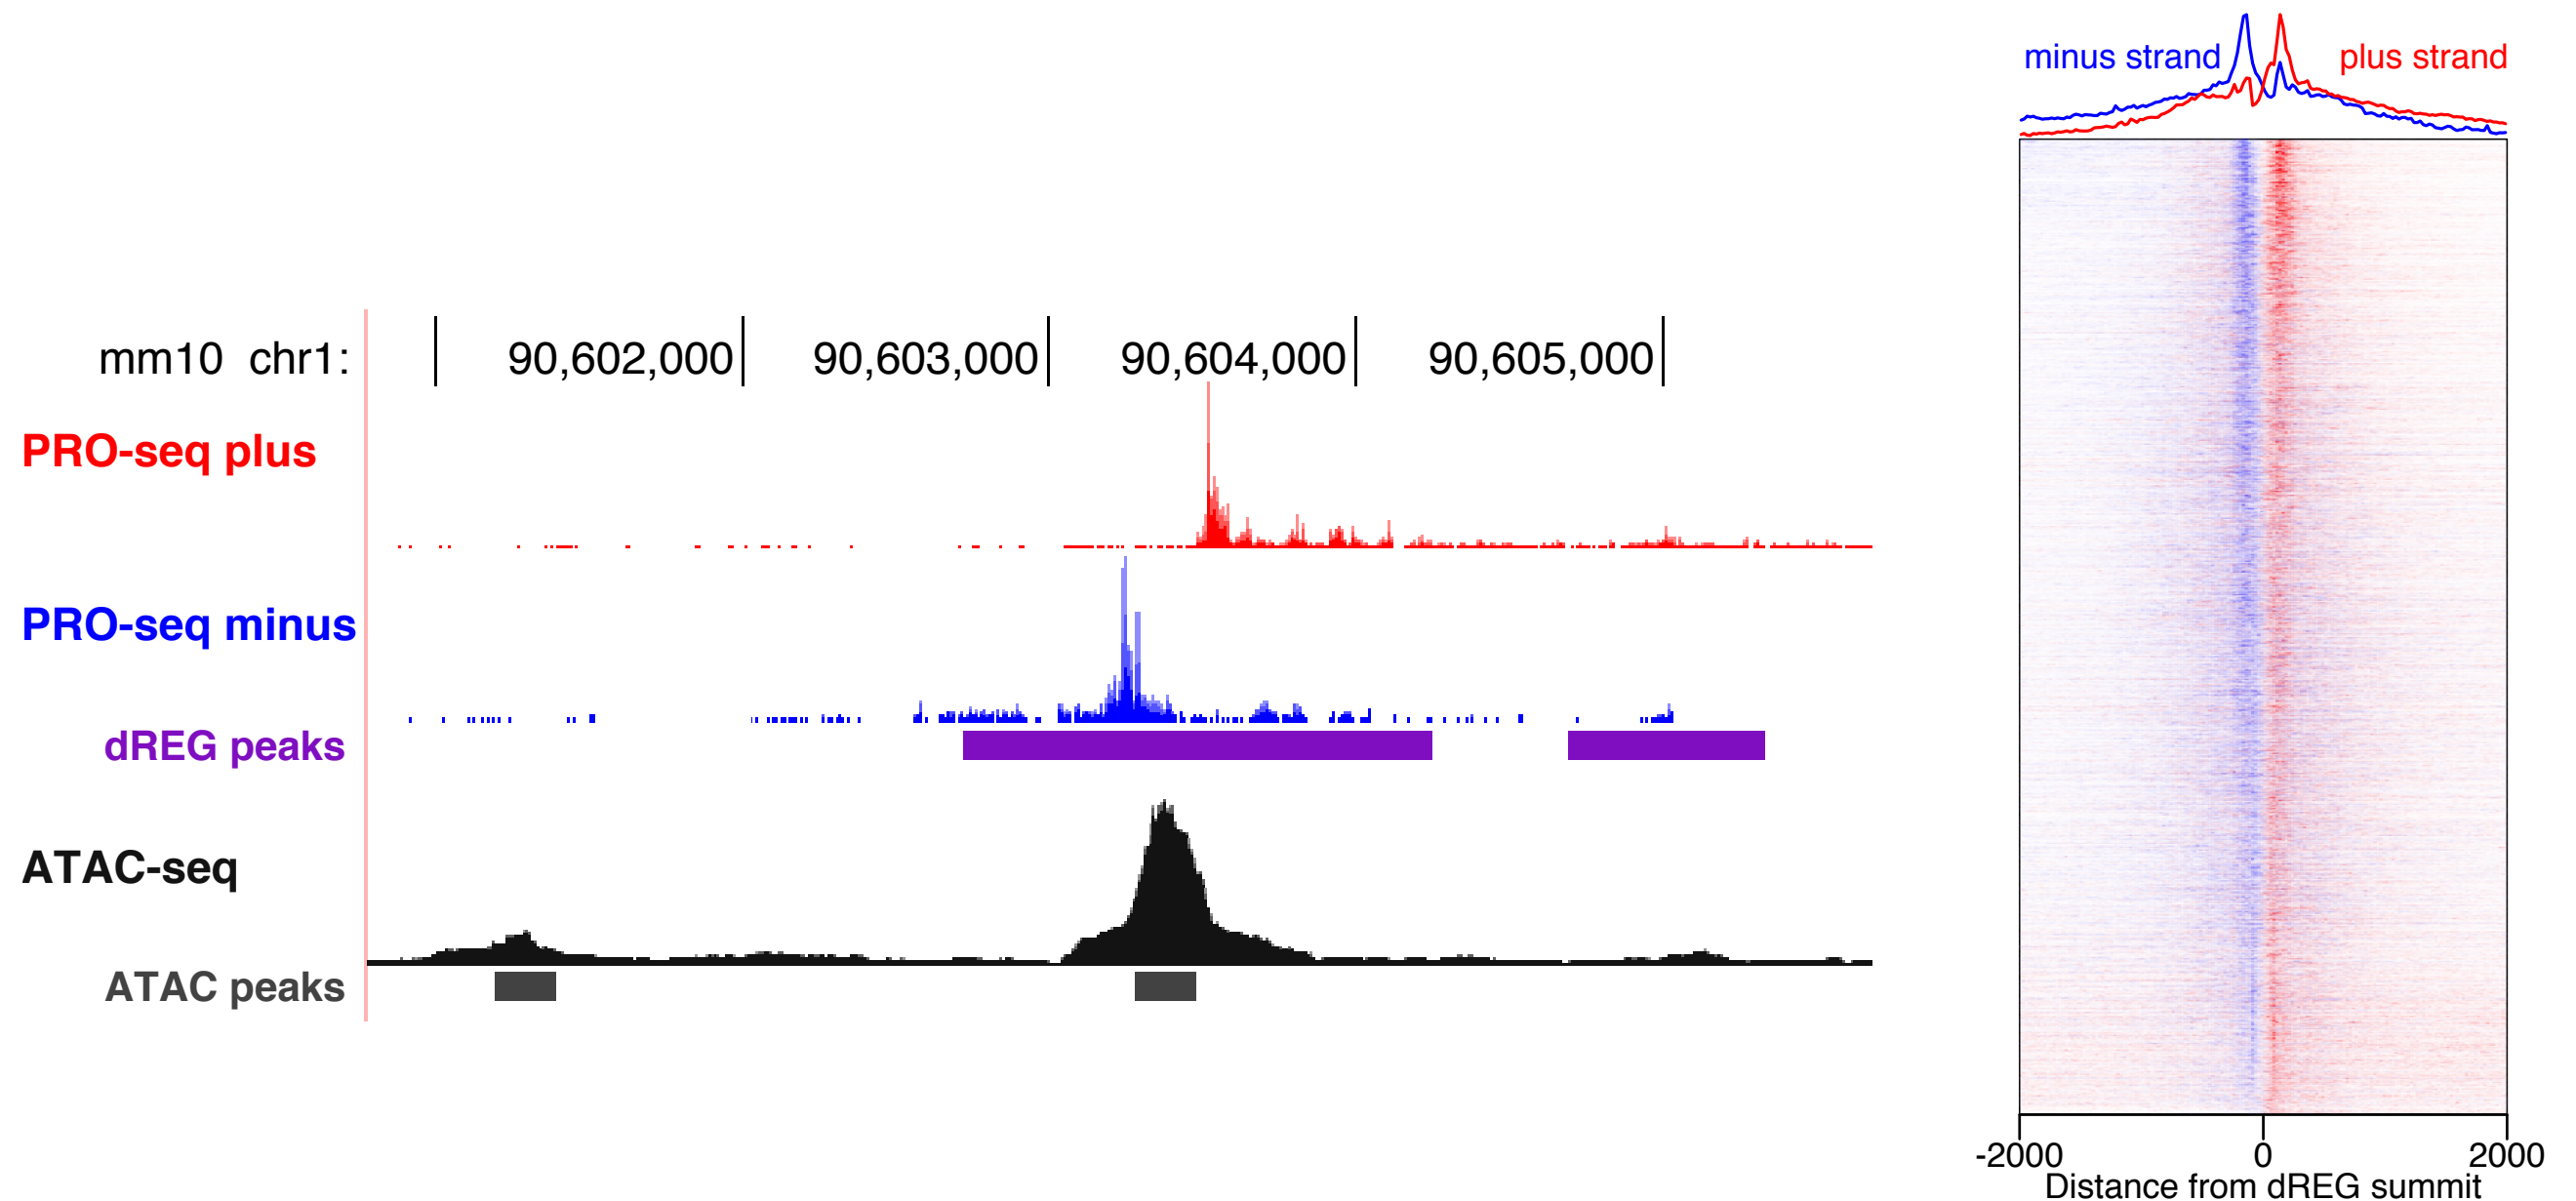

# *de novo* motif analysis identifies enriched sequence elements within dynamic ATAC peaks

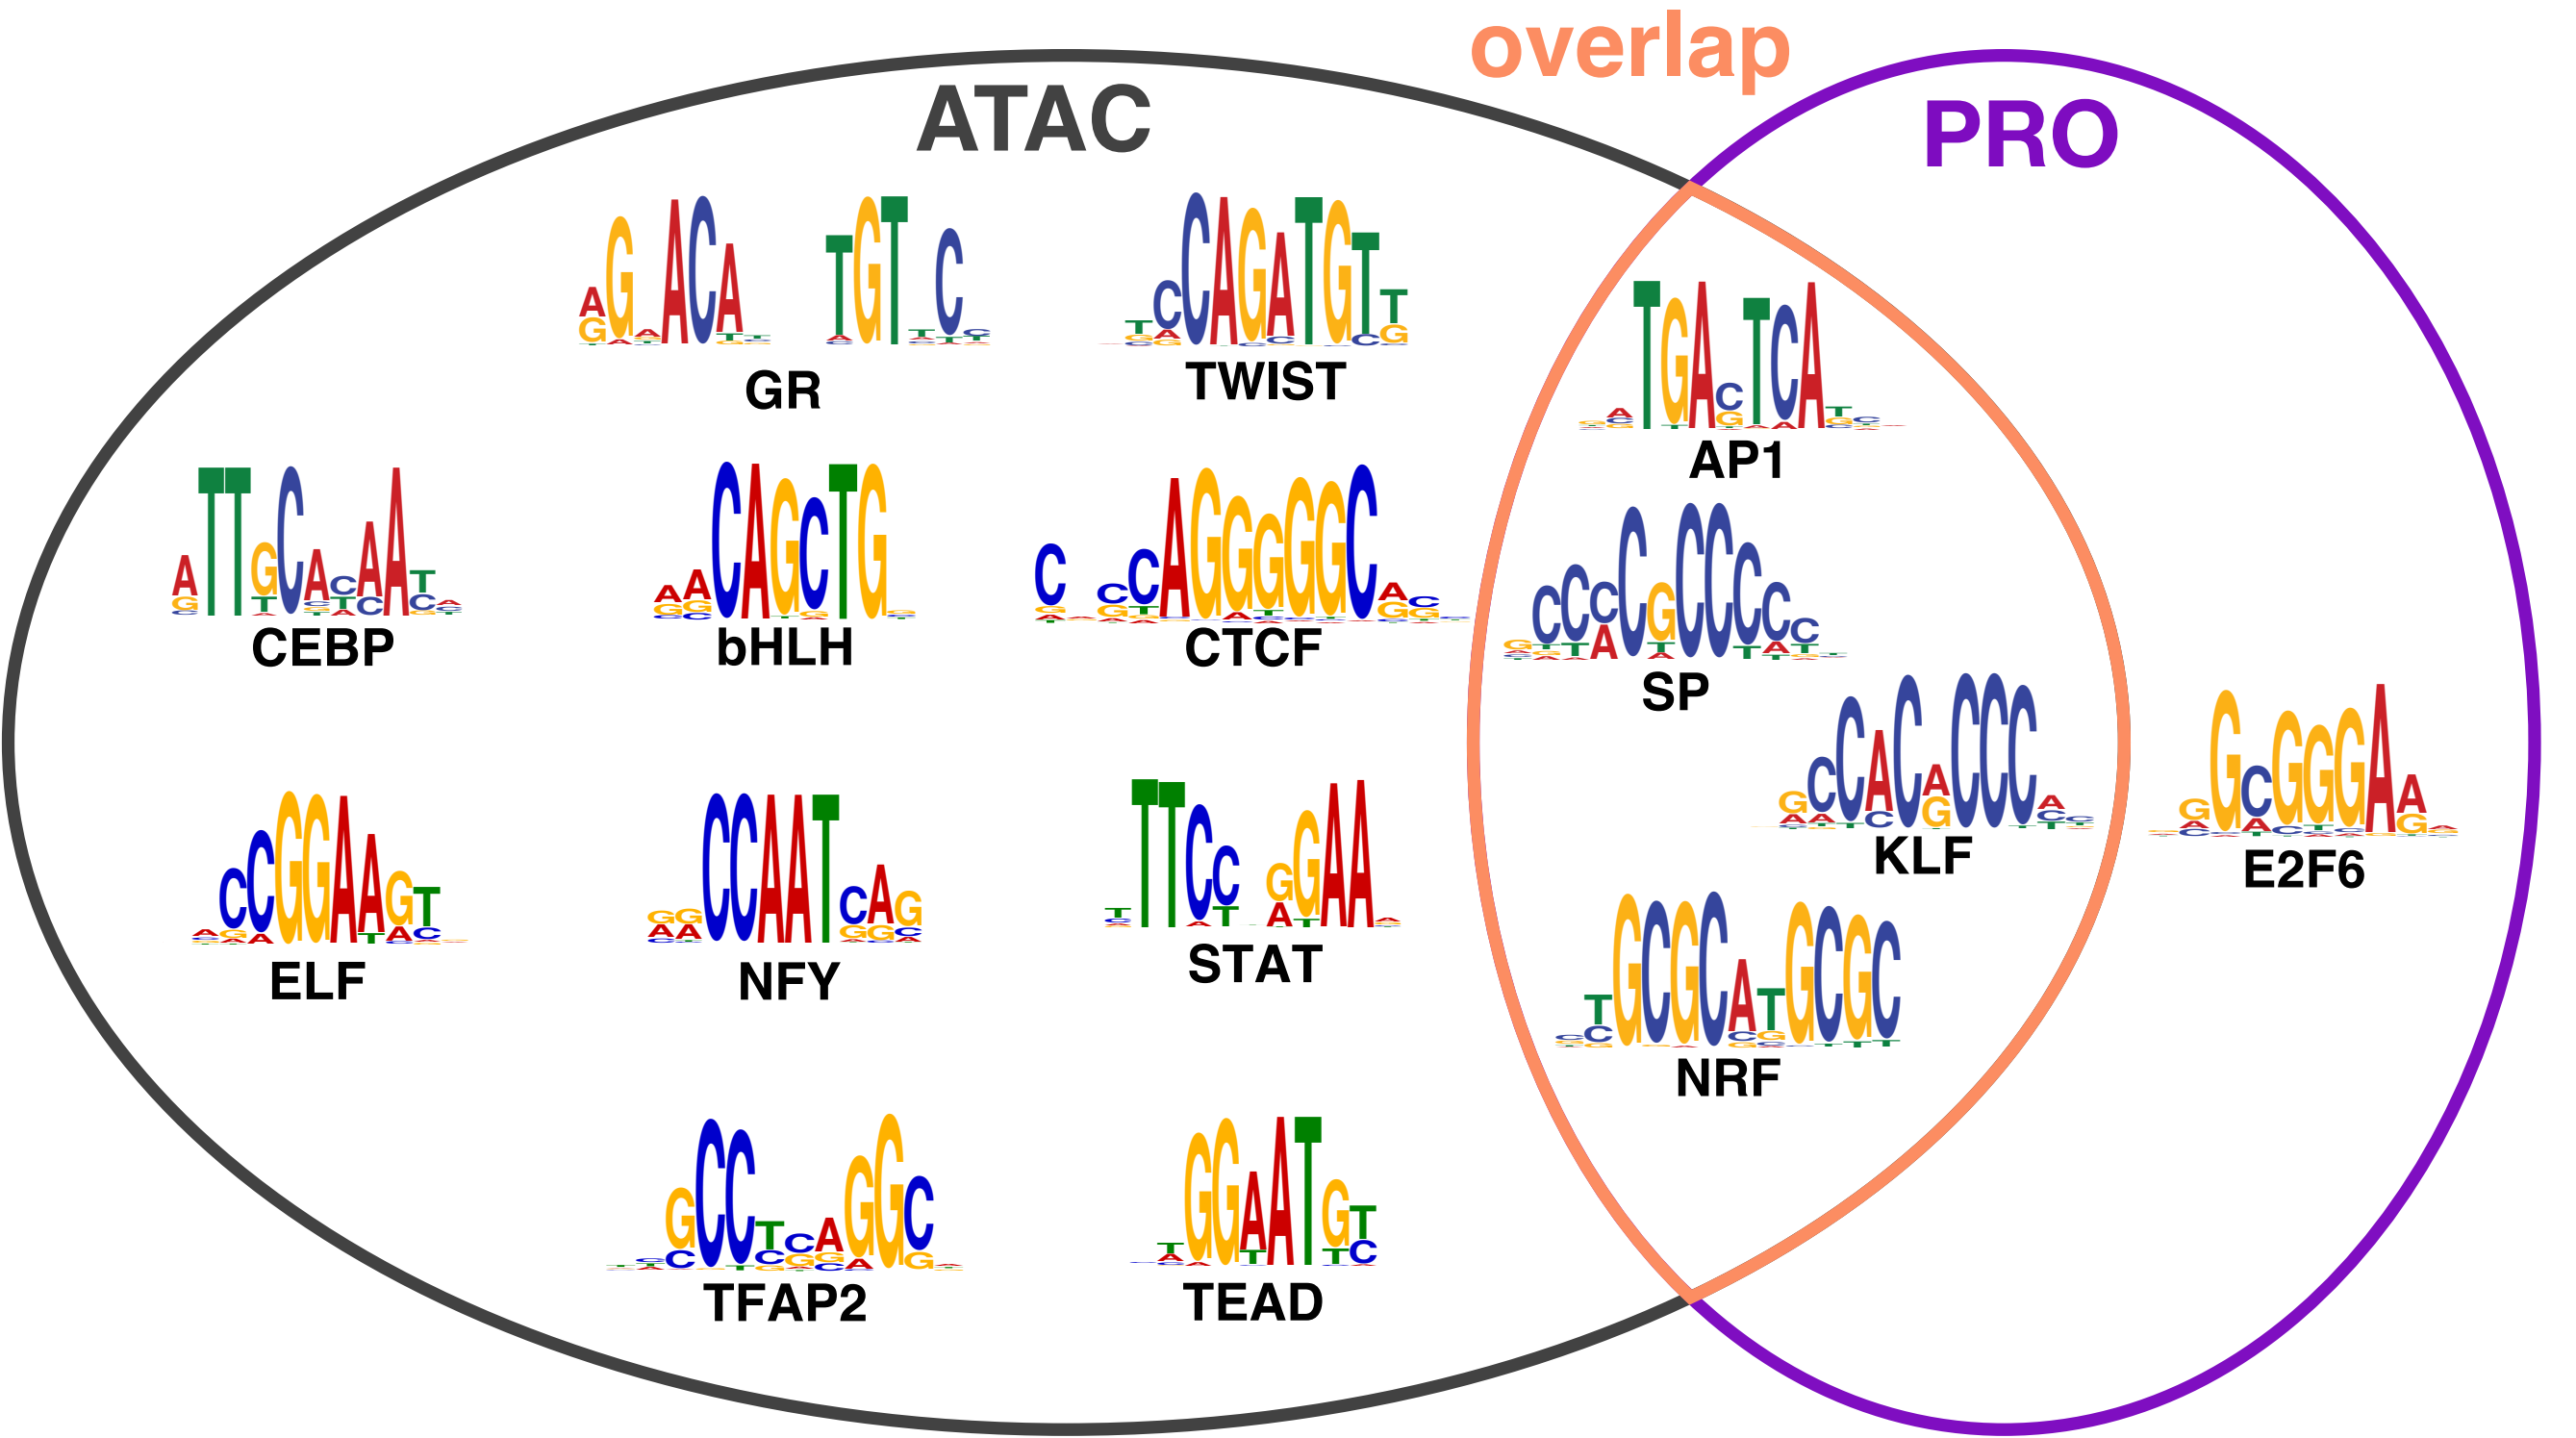

# *de novo* motif analysis identifies enriched sequence elements within dynamic ATAC peaks

# Bidirectional transcription signatures from PRO-seq independently identifies putative regulatory regions

Motifs enriched within dynamic ATAC and bidirectional PRO peaks

# 14 TF-family motifs (top 6 shown) drive early changes in chromatin and transcription

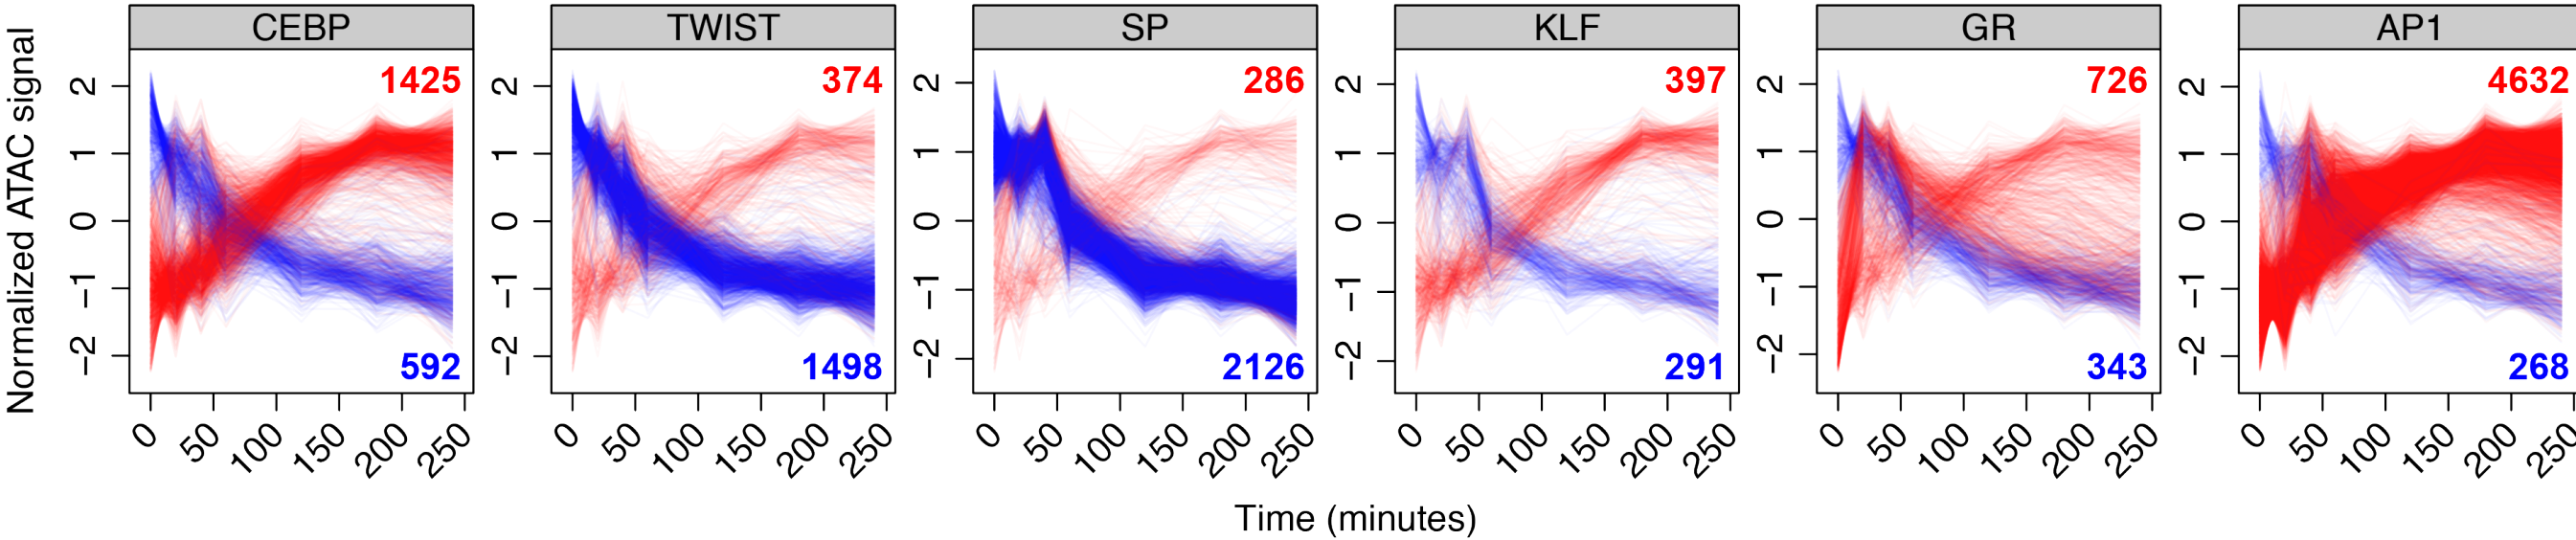

Paralogous TF DBD families that recognize each motif

CEBP, KLF, GR, and AP1 motifs associate w/ **increasing** chromatin accessibility  
TWIST and SP associate w/ **decreasing** chromatin accessibility

CEBP, KLF, GR, and AP1 motifs associate w/ **increasing** chromatin accessibility  
TWIST and SP associate w/ **decreasing** chromatin accessibility

# Genes also have distinct activation and repression kinetics

# Linking direct functional interactions between Regulatory Elements (RE) and Genes (TU)

# We are interested in highly connected early response transcription factors

# TWIST2 is active early and transiently

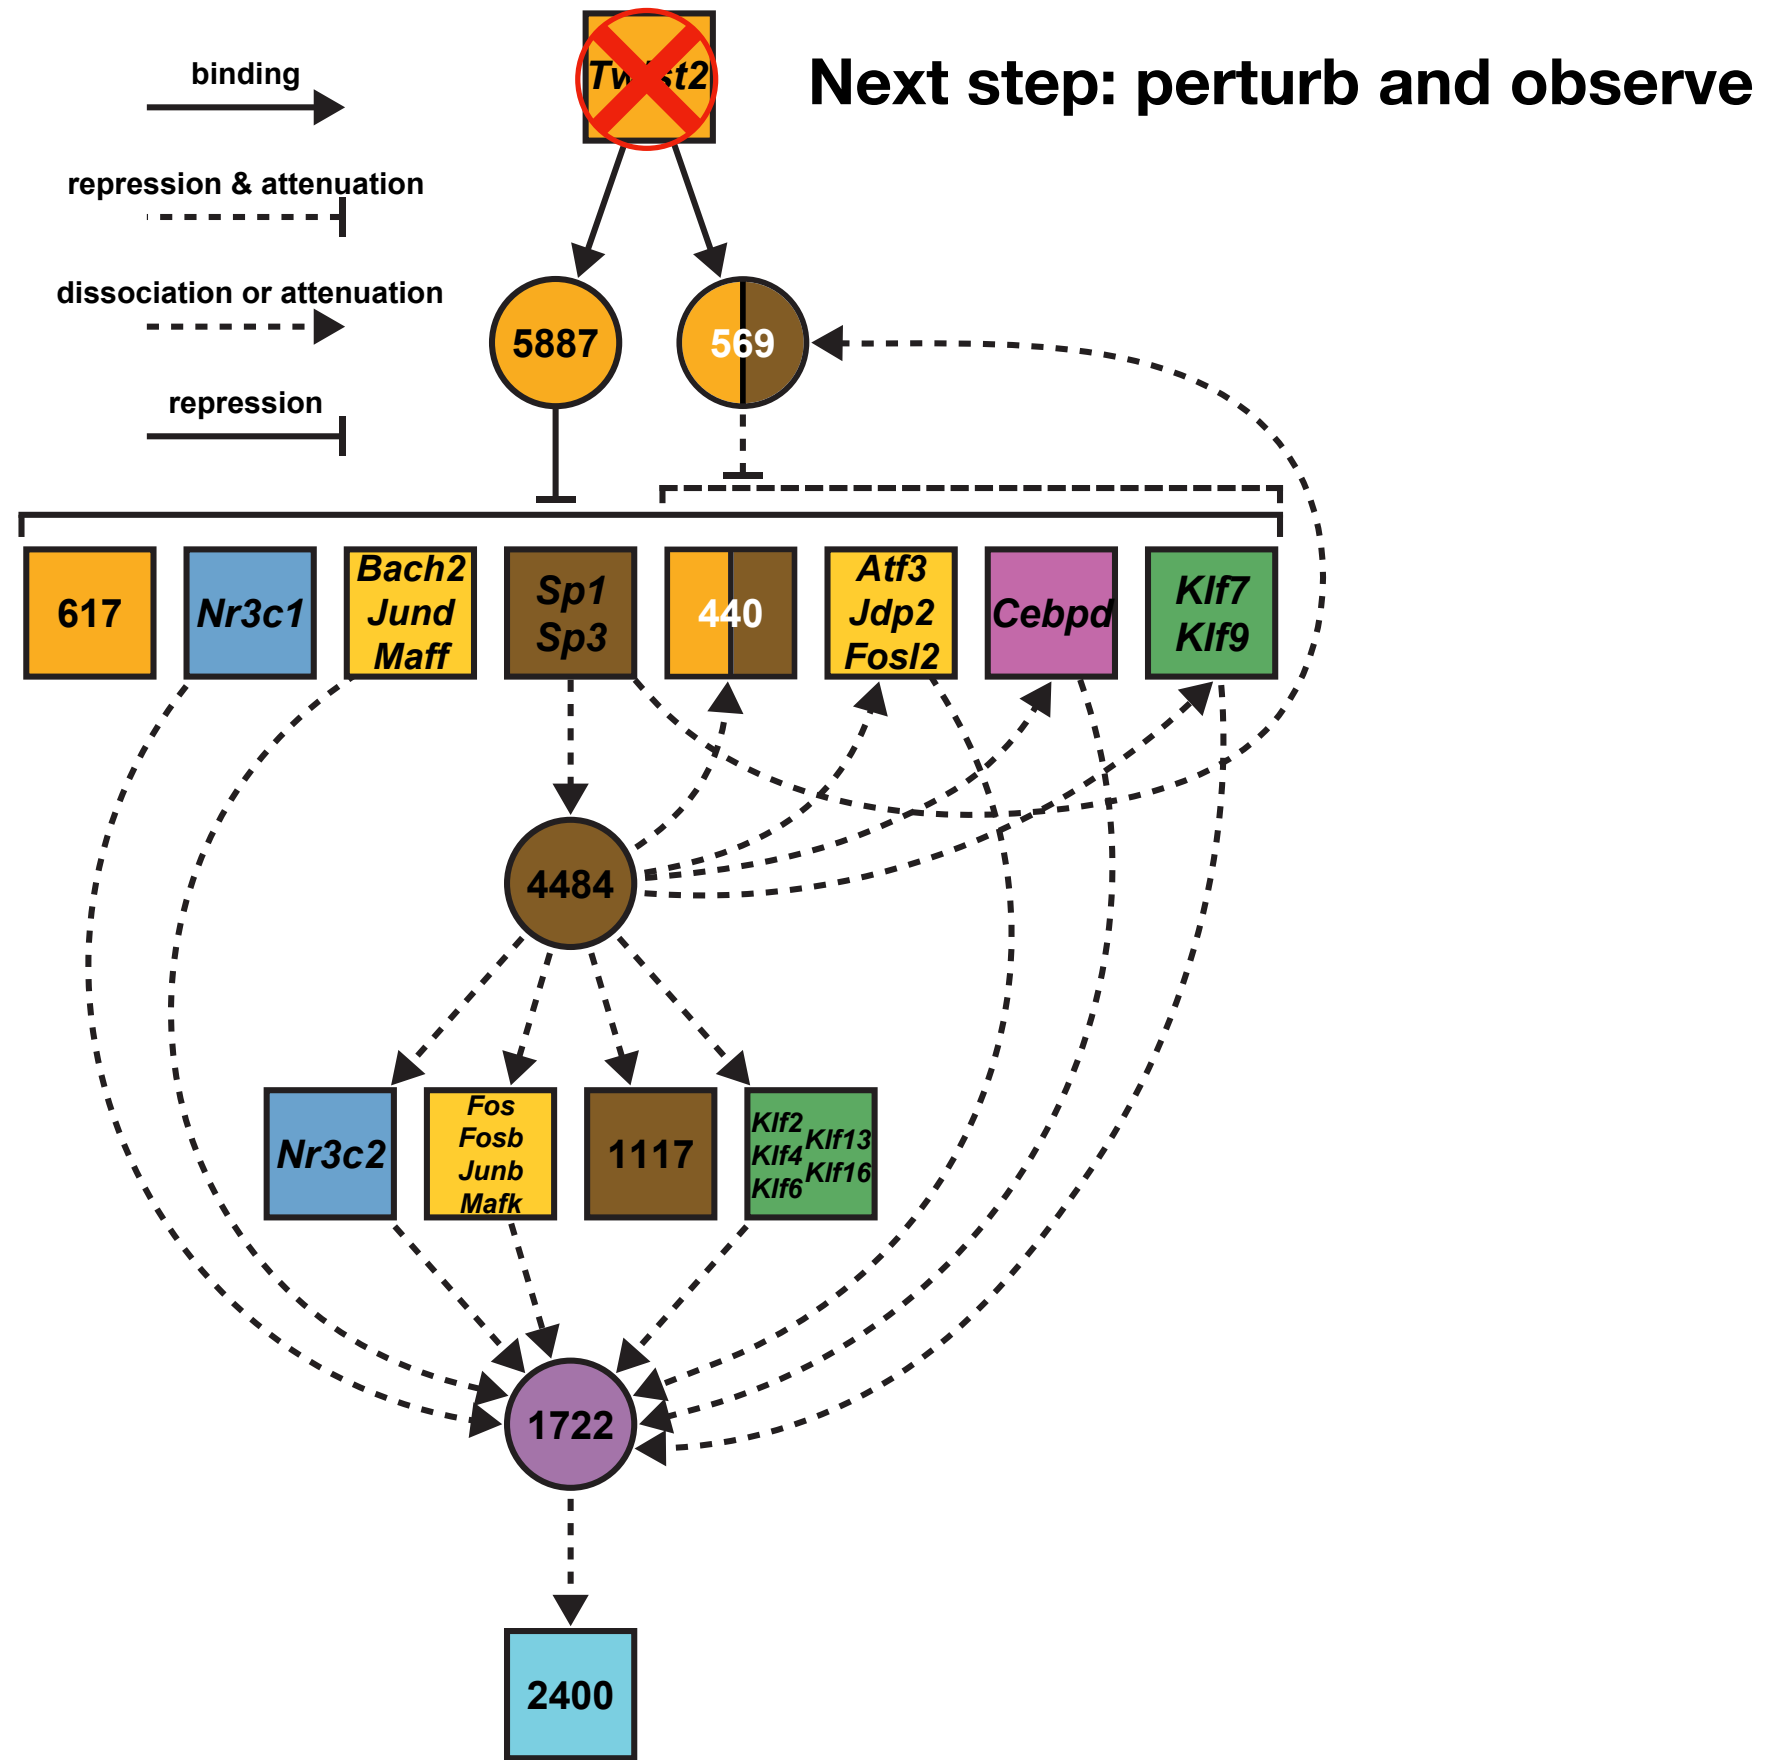

# TWIST2 is a highly connected early response gene

# TWIST2 is a highly connected early response gene

# Twist2 depletion and over expression in 3T3-L1 cells modulate adipogenesis

Twist2 heterozygote mice have increased differentiation of ex vivo cultured white adipocytes

Twist2<sup>+/-</sup> mice have a near absence of subcutaneous fat

# Twist2<sup>-/-</sup> mice have reduced lipid droplets in brown fat

Can we reconcile the *in vitro* and *in vivo* results?

Recall: *in vitro* Twist2 **restricts** adipogenesis/lipid droplet formation  
*in vivo* Twist2 **promotes** adipogenesis/lipid droplet formation

# Build up of fatty acids cause ER stress, which can lead to cell exhaustion and death

DGAT1 activation during lipolysis leads to re-esterification of fatty acids to prevent ER damage

A metaphor to communicate the *in vitro* and *in vivo* results:  
climbing Mount Development to become a mature adipocyte -/+ Twist2

Twist2 slows you down *in vitro*, but you form adipocytes;  
resources are provided, just as we change out the media and split cells

Preadipocytes thrive without Twist2 slowing them down *in vitro*;  
adipogenesis and fat deposition are more efficient

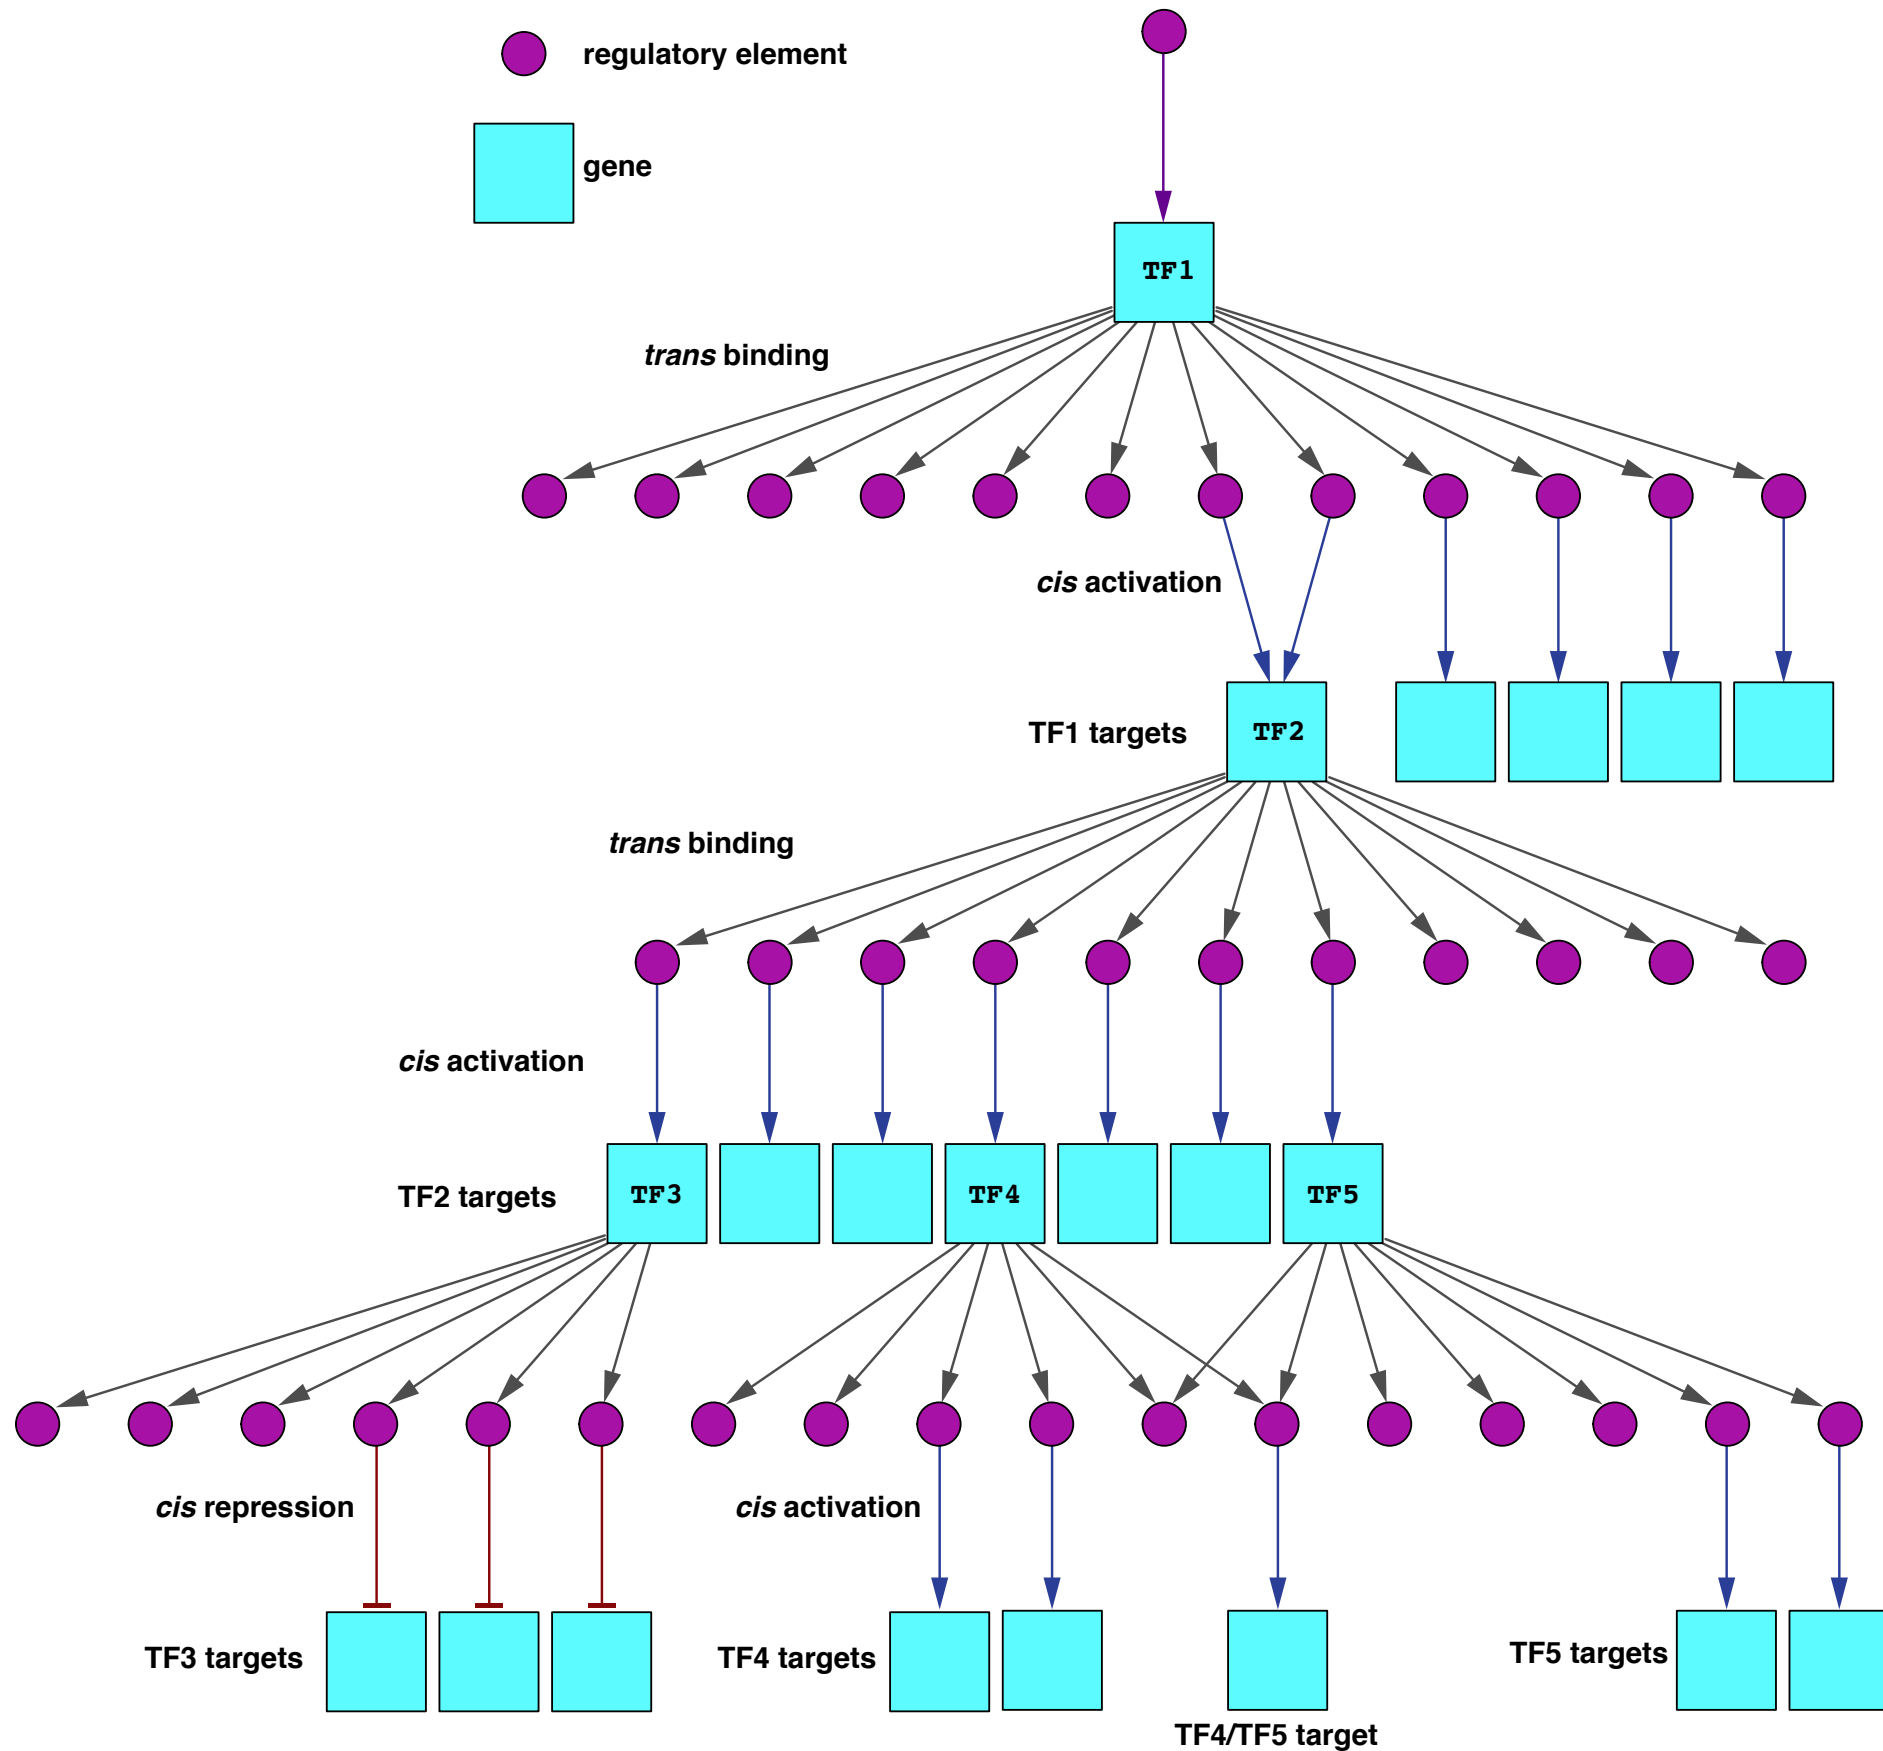

Supporting tissues have resources to ascend Mount Development *in vivo*;  
Twist2 forces you to pace with other tissues and you form adipocytes

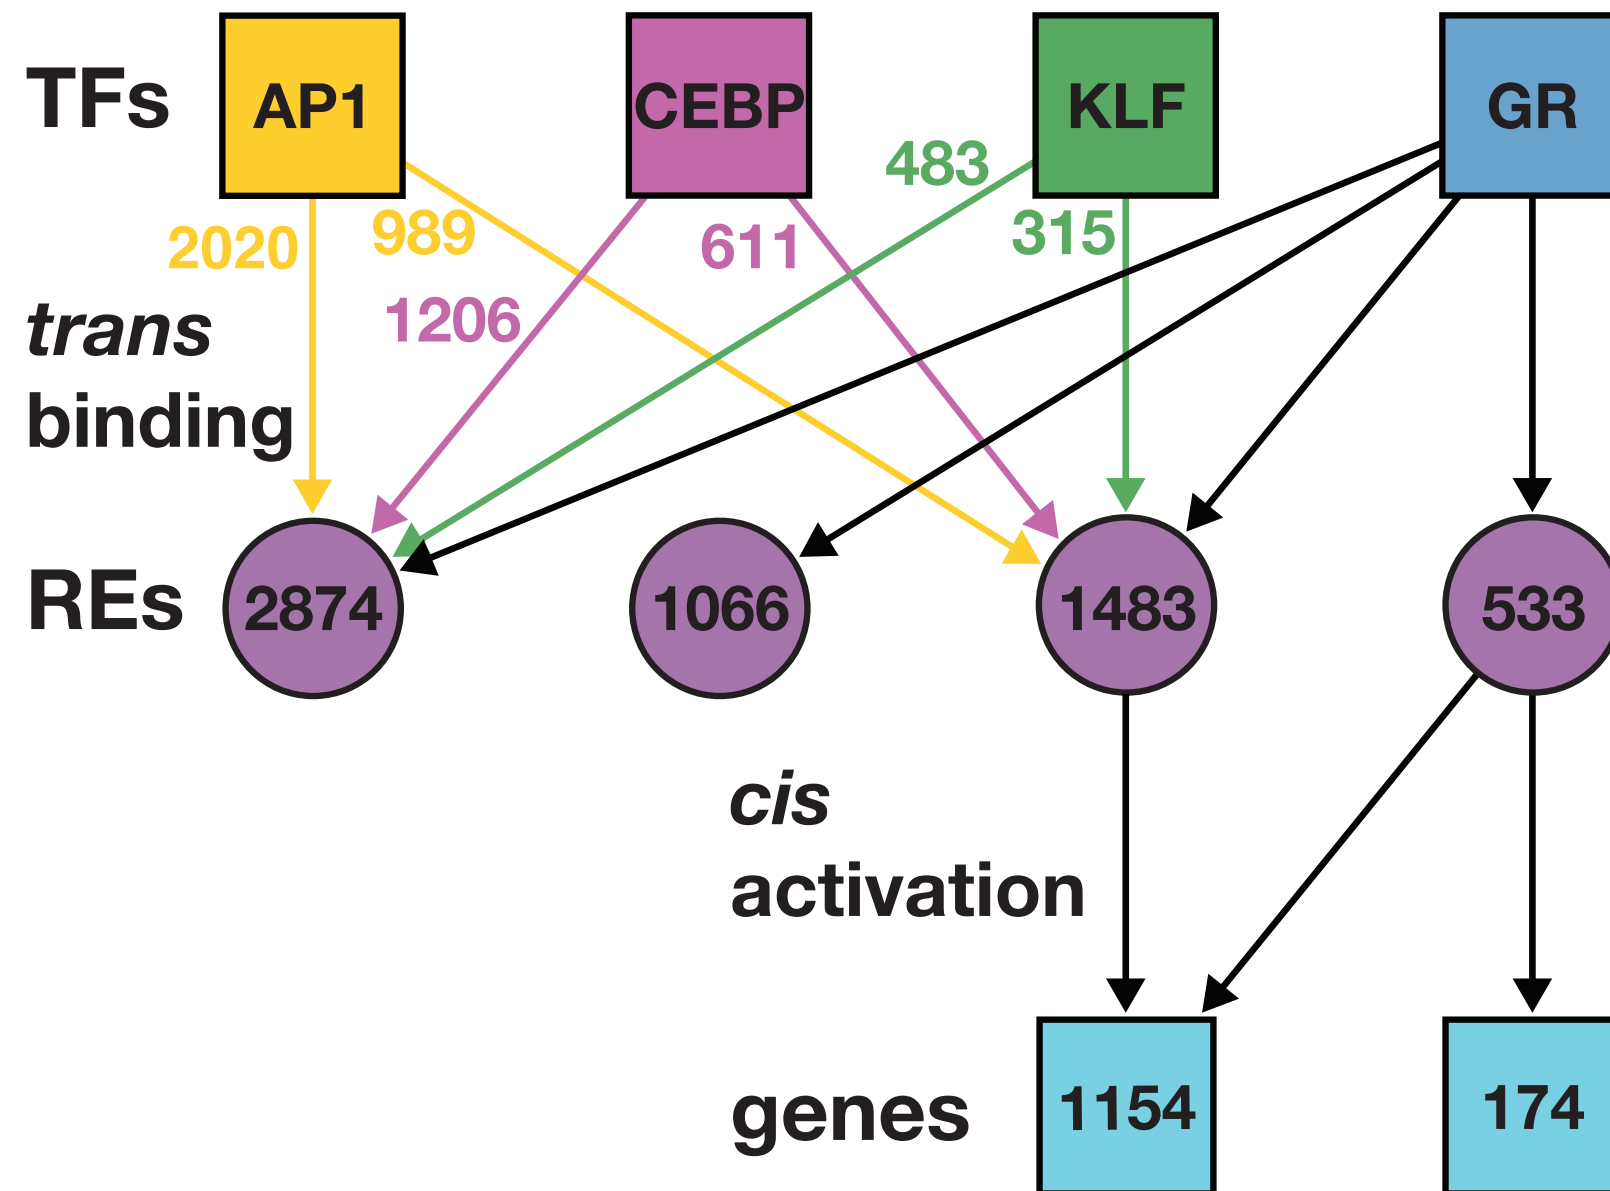

Healthy adipocytes do not develop *in vivo* without Twist2;  
preadipocytes ascend too quickly and tissues can not provide support

# What are the molecular functions of these key TFs?

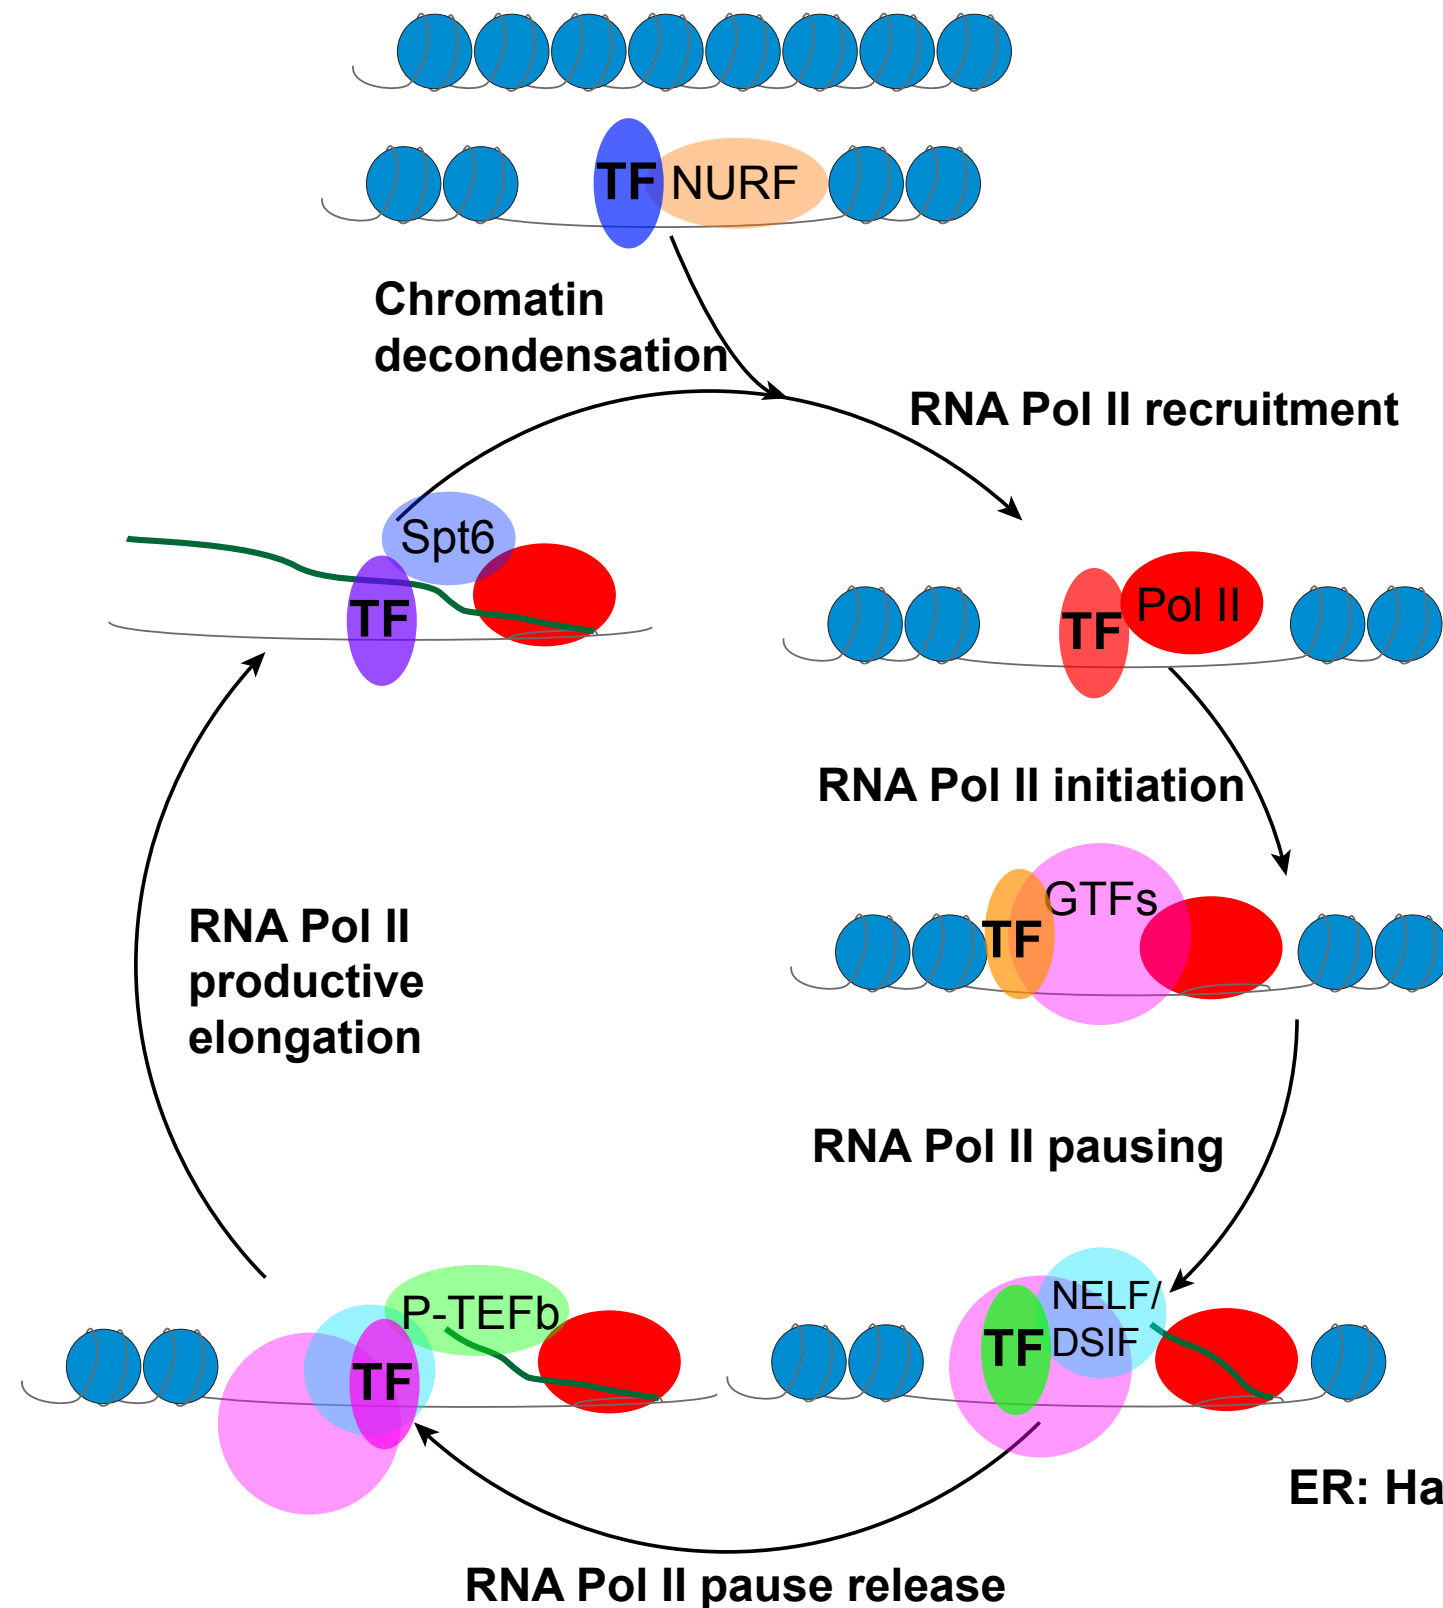

Simplified networks identify genes that are primarily regulated by a single factor

# Coupling rapidly inducible systems to nascent transcript profiling informs on TF function

# Coupling rapidly inducible systems to nascent transcript profiling informs on TF function

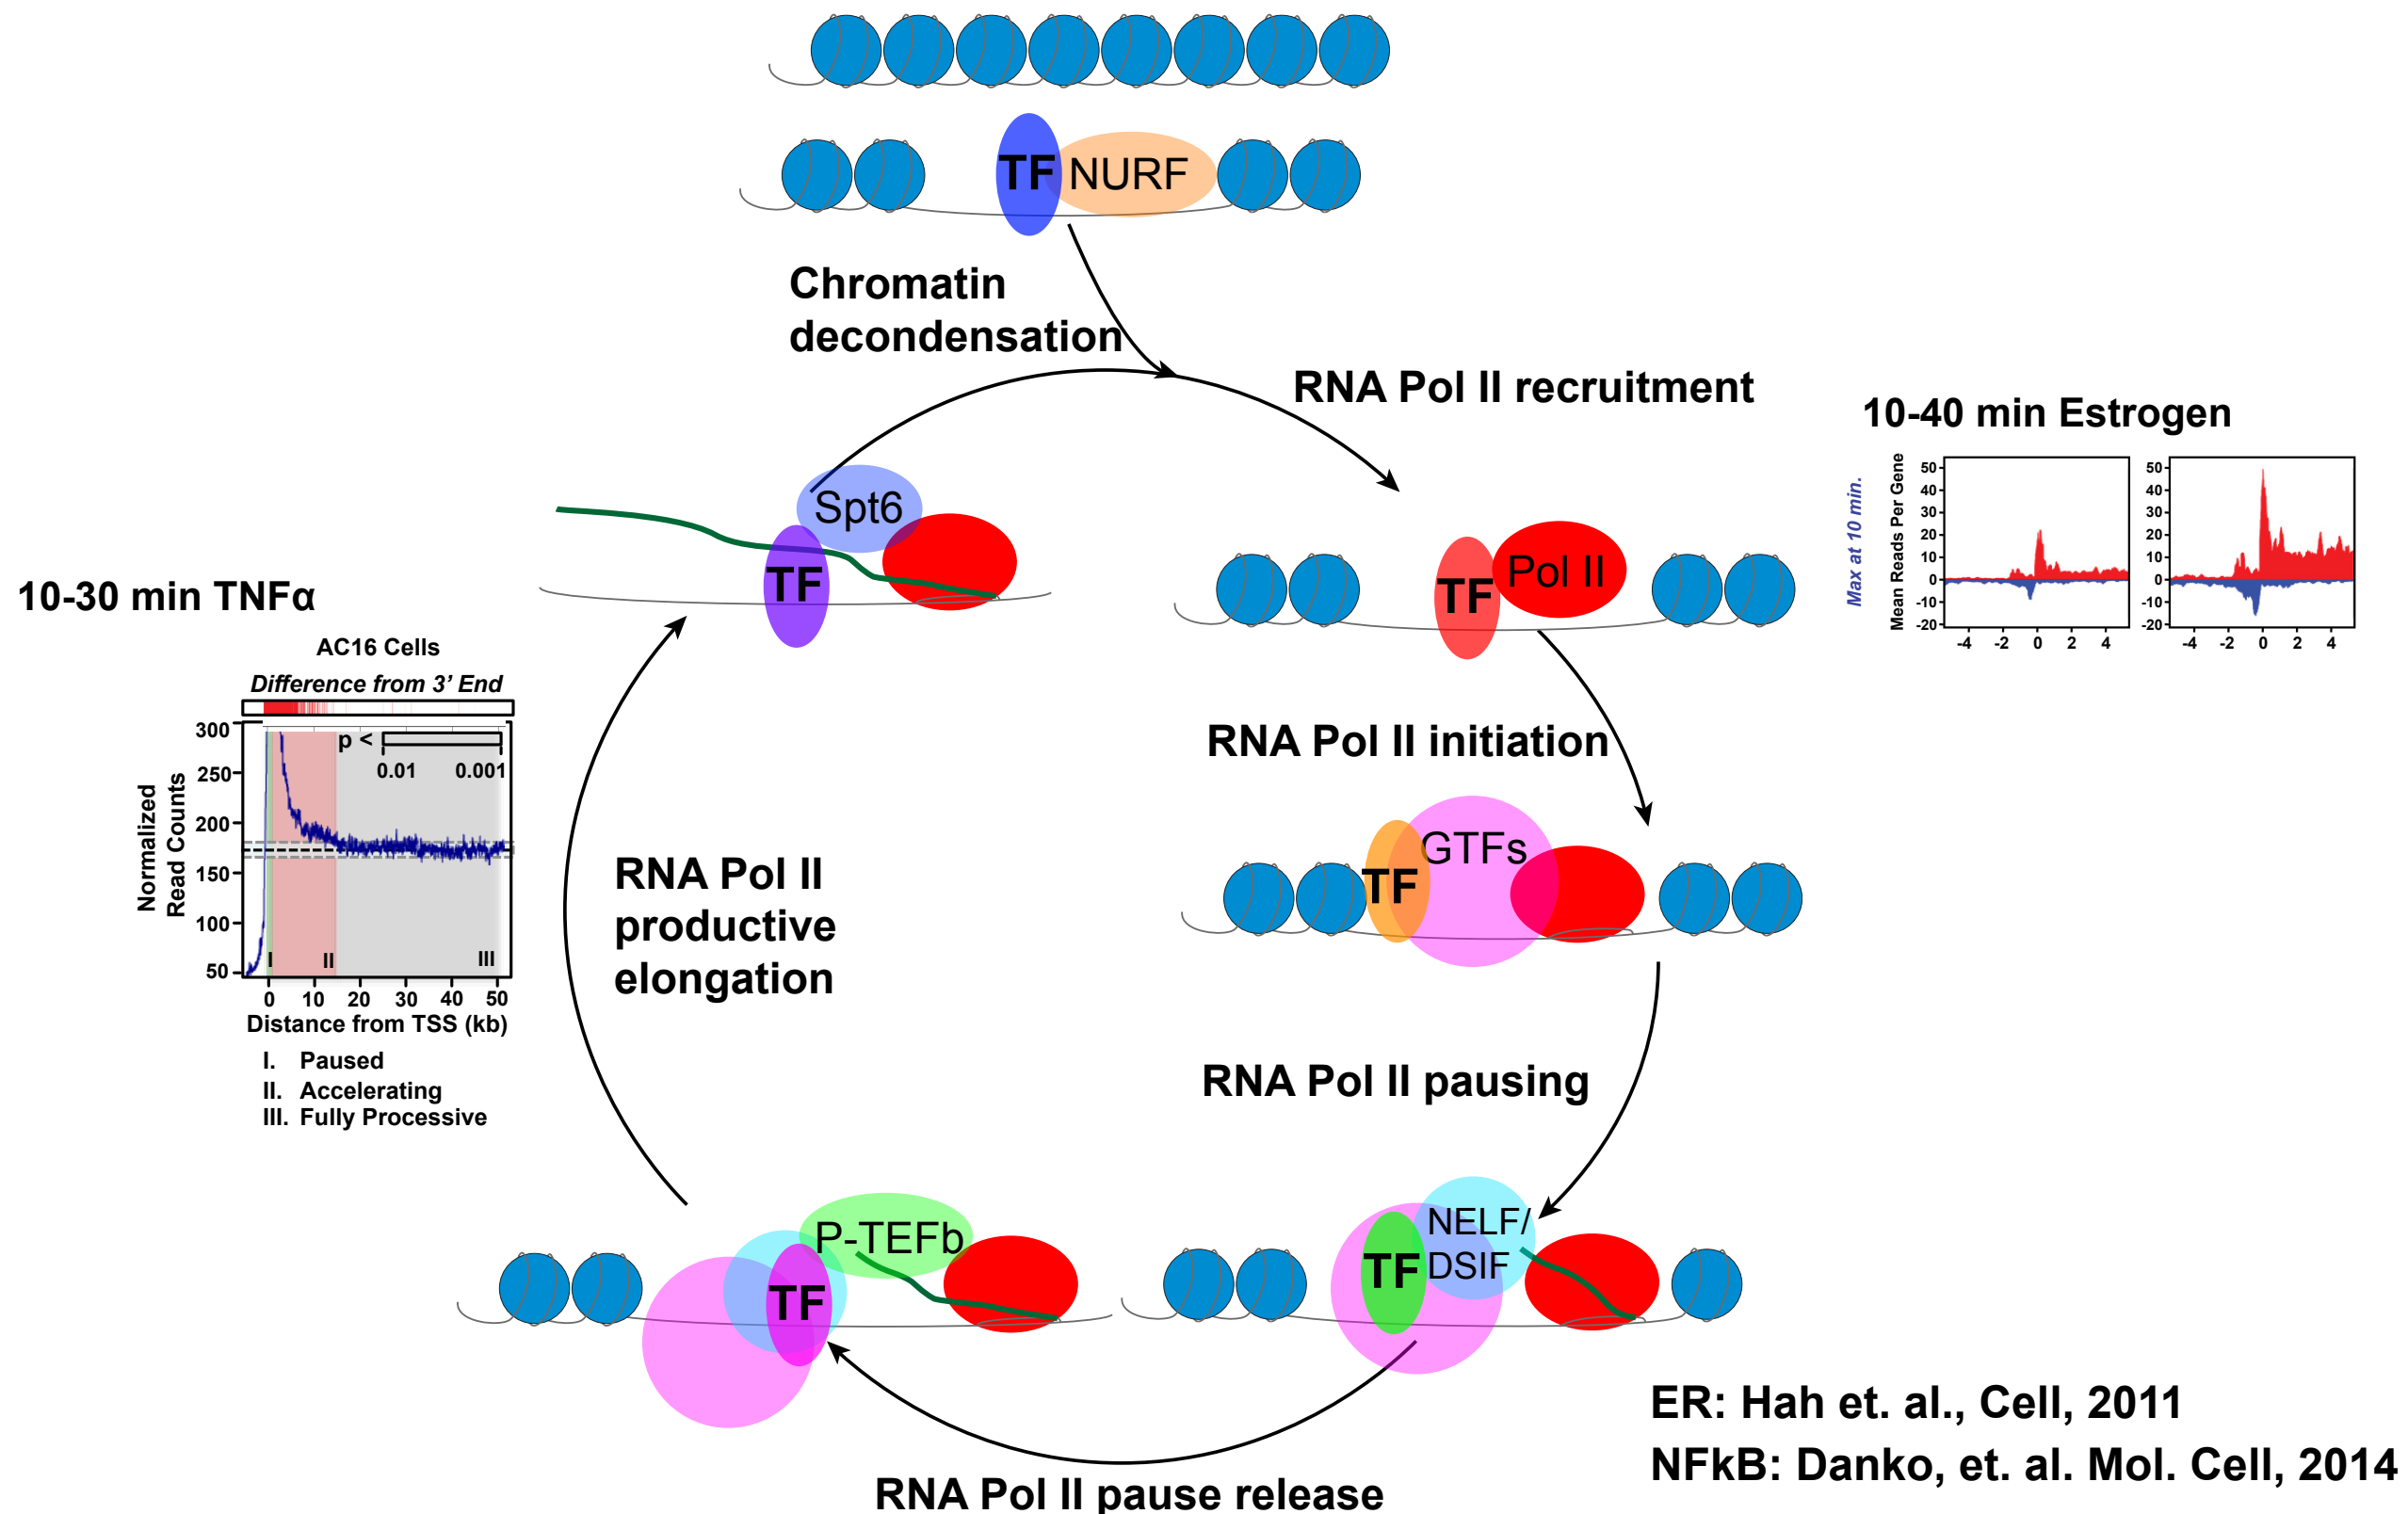

10-40 min Estrogen

# Coupling rapidly inducible systems to nascent transcript profiling informs on TF function

**We can determine the step(s) that a TF regulates by quantifying RNA polymerase density changes in genic regions**

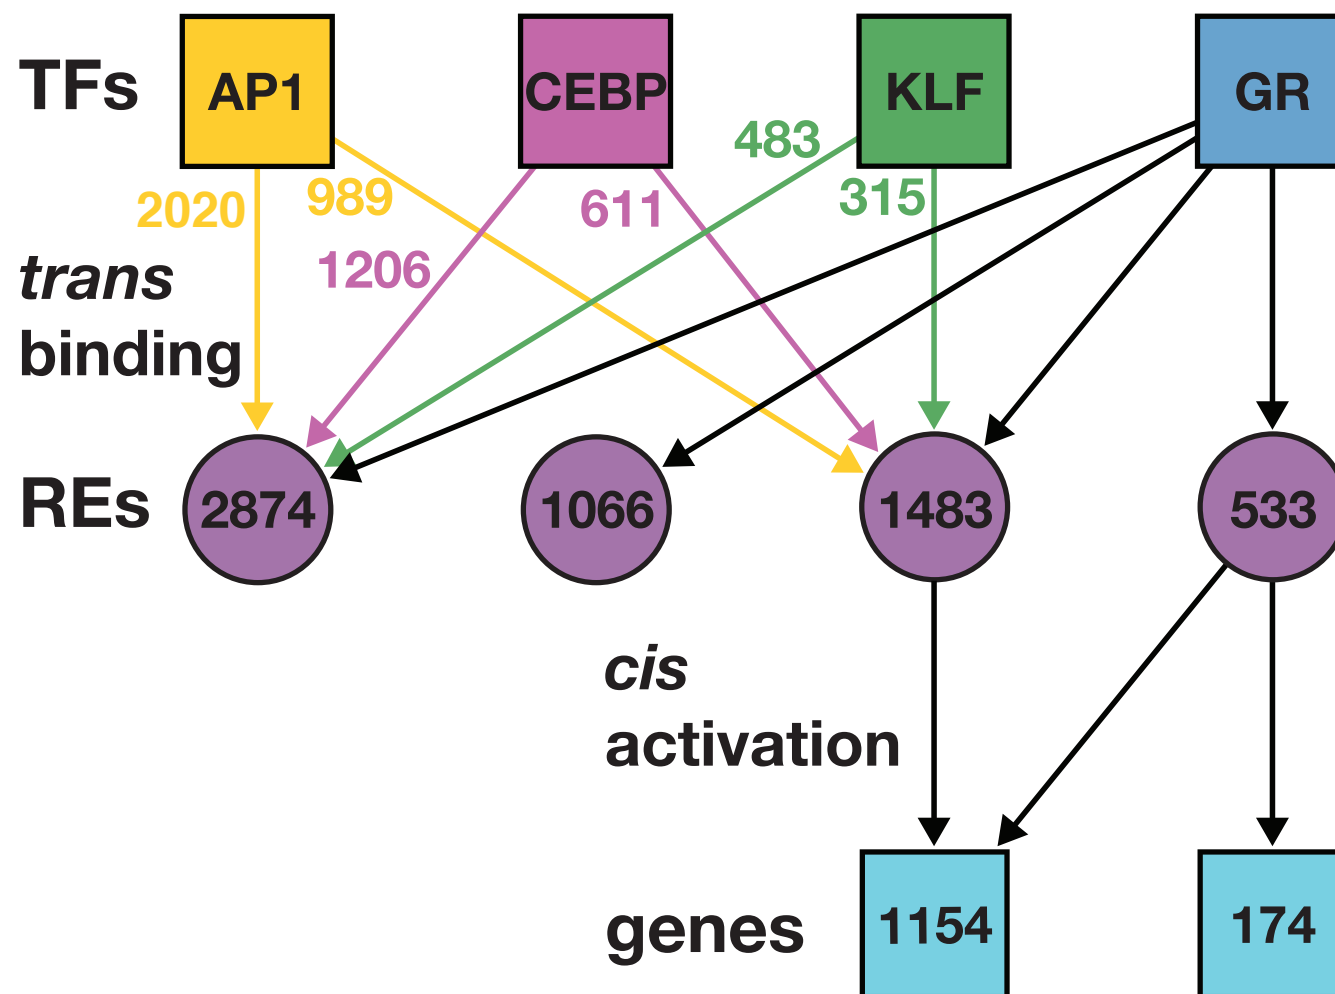

$$\frac{dp}{dt} = k_{init} - (k_{pre} + k_{rel}) p$$

$$\frac{db_1}{dt} = k_{rel} p - k_{elong} b_1$$

$$\frac{db_2}{dt} = k_{elong} b_1 - k_{elong} b_2$$

$$\frac{db_x}{dt} = k_{elong} b_{x-1} - k_{elong} b_x$$

# Simplified networks identify genes that are primarily regulated by a single factor

# GR preferentially regulates pause release

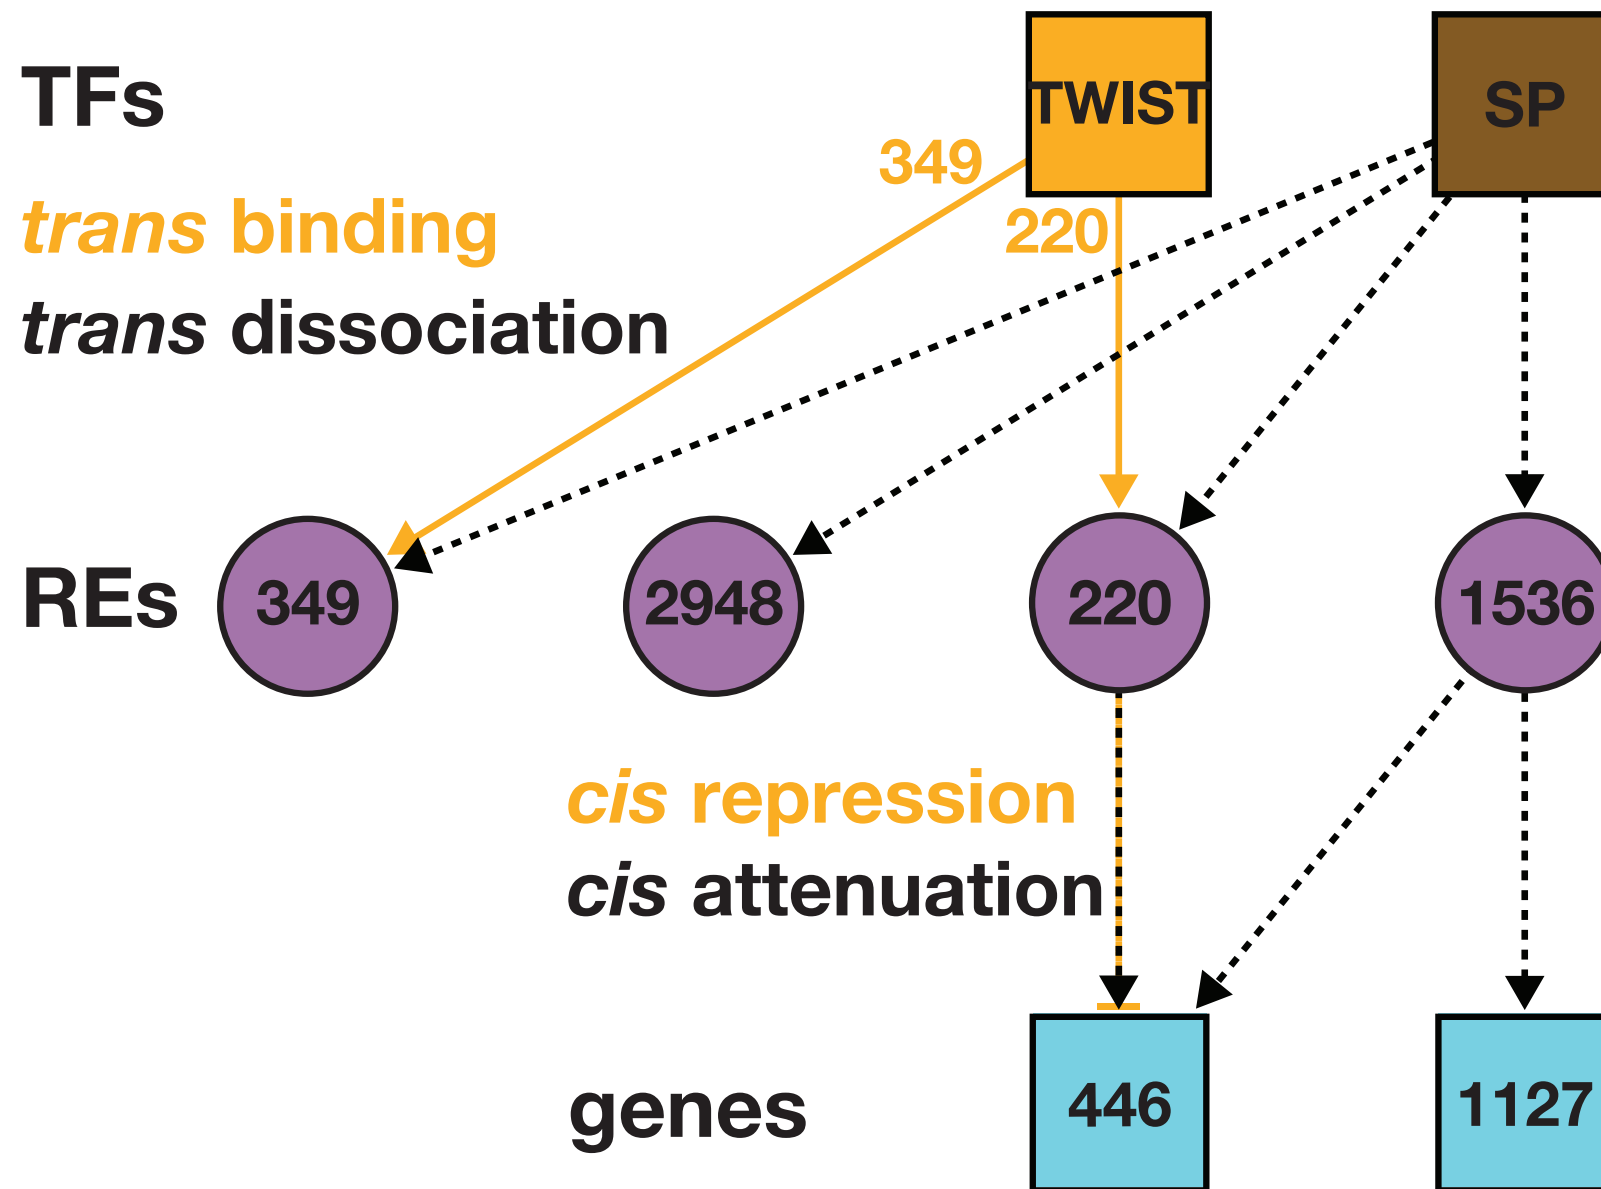

# GR preferentially regulates pause release

# GR preferentially regulates pause release in another system: Leukemia cells treated with dexamethasone for 1 hour

Simplified networks identify genes that are primarily regulated by a single factor

# SP preferentially regulates initiation rate

# Adipogenesis Network Conclusions

# Adipogenesis Network Conclusions

- Kinetic ATAC and PRO data can be used to infer key functional interactions between regulatory elements and genes.

# Adipogenesis Network Conclusions

- Kinetic ATAC and PRO data can be used to infer key functional interactions between regulatory elements and genes.
- TWIST2 is a highly connected node in the adipogenesis network.

# Adipogenesis Network Conclusions
